

The Authority Platform

A comprehensive design, feature and engineering specification for the personal brand and professional authority website of Dr. Ishmael Nii Amanor Dodoo — diplomat, development economist, and Chief Partnership Officer of Ghana's 24-Hour Economy and Accelerated Export Development Programme.

DOCUMENT	Project AMANOR — Website Build Brief and Technical Specification
VERSION	1.0 — Issue for Build
DATE	26 July 2026
PREPARED BY	XCreativs Technologies Ltd, Accra, Ghana
PREPARED FOR	Dr. Ishmael Nii Amanor Dodoo (Principal) and the Project AMANOR engineering team
CLASSIFICATION	Confidential — Client and Delivery Team Only
STATUS	Approved for estimation, sprint planning and build kick-off
SUPERSEDES	None. This is the founding specification for the engagement.

IN SHORT

This document tells the engineering team exactly what to build, why each part of it exists, and what "finished" looks like. It is written to be read end-to-end by a product lead, and dipped into by designers, engineers and content producers.

It specifies a **thirteen-page bilingual platform**, **fifteen signature features**, and a **Protocol Desk** — a speaking-engagement intake system that behaves less like a contact form and more like a diplomatic protocol officer. Nothing in here is decoration. Every feature answers a problem the Principal actually has.

00 How to Use This Document

This specification is long by design. A person of the Principal's standing does not need a website; he needs an instrument of authority, and instruments require precision. Rather than reading it cover to cover, use the reader map below.

ROLE	READ FIRST	READ FULLY	SKIM
Product Lead / Account Director	01, 03, 16, 18	All sections	—
UX / Product Designer	03, 04, 05, 06	04, 05, 06, 07	10, 11, 12
Frontend Engineer	04, 06, 07, 10, 13	06, 07, 10	02, 03
Backend Engineer	08, 09, 10, 11, 12	08, 09, 12	04, 06
AI / Data Engineer	07 (F05, F06), 09, 12	07, 09, 13	04, 06
Content Producer / Editor	02, 03, 06, 15, App. C	02, 03, 15	10, 11
QA Lead	06, 08, 17	17	All
The Principal	01, 02, 03, 07, 18	18 (decisions required)	Technical sections

Conventions used

- **Feature codes.** Signature features are numbered **F01** to **F15** in Section 07 and referenced by code everywhere else. Use these codes as Jira epic names verbatim.
- **Page codes.** Pages carry codes **P01** to **P13** as set out in Section 05. Jira stories should carry the page code in the summary line.
- **Must / should / may.** **Must** is a launch blocker. **Should** is expected in the launch window but may be traded against schedule with the Product Lead's written approval. **May** is a post-launch candidate.
- **The Principal.** Throughout this document, "the Principal" means Dr. Ishmael Nii Amanor Doodoo. "The Office" means the 24-Hour Economy and Accelerated Export Development Authority, his public employer.

STANDING INSTRUCTION

Nothing about this build is neutral. The Principal holds public office in Ghana. Every feature, every form field and every published word carries an institutional consequence he personally bears. Where this document appears cautious, that caution is deliberate and is not to be engineered away for convenience.

01 The Engagement

1.1 Why this platform exists

Dr. Ishmael Nii Amanor Dodoo has spent more than twenty-five years accumulating a record that almost nobody can find. He has served in the Executive Office of the United Nations Secretary-General. He coordinated the UN's response architecture across ten Sahel countries and nineteen agencies. He ran the Ebola crisis desk at UNDP's Africa Bureau during the worst months of the West African epidemic. He now sits at the commercial heart of Ghana's single largest economic restructuring programme in a generation.

And the sum total of his public digital presence is a six-page PDF, a LinkedIn profile, and roughly forty news articles that cannot agree on what his job title is.

That gap is the entire commercial case for this project. The Principal's influence is real, his network is real, and his record is exceptional — but all of it currently depends on someone already knowing who he is. A person of his standing should never have to introduce himself twice.

1.2 The five problems we are actually solving

This is not a vanity build. Each of the following is an observed, documented failure in how the Principal's reputation currently travels.

- 01 The title problem.** In public reporting the Principal is variously described as Head of Innovative Finance, Director and Head of Innovative Finance Partnerships and Markets, Chief Partnership Officer, Director of Partnerships, and Director and Head of Partnership and Market. All of these have appeared in credible Ghanaian outlets within an eighteen-month window. There is no canonical source for a journalist to check, so each newsroom invents one. **F04, the Canonical Identity Registry, exists solely to end this.**
- 02 The identity-collision problem.** Search engines routinely confuse the Principal with at least two other prominent Ghanaians — Dr. Ishmael Yamson, a member of the Presidential Advisory Group on the Economy, and Professor Francis Dodoo of AFIDEP. Both appear in the same policy conversations. Without deliberate entity disambiguation, a share of the Principal's reputational equity is being credited to other men. **Section 13 addresses this at the knowledge-graph layer.**
- 03 The booking problem.** Speaking invitations currently arrive through LinkedIn messages, WhatsApp, intermediaries and third-party protocol officers. There is no triage, no record, no capacity check, and no way for a conference organiser in Nairobi or Brussels to know whether the request was ever seen. **Section 08, the Protocol Desk, replaces all of this.**
- 04 The capacity problem.** The Principal wears at least three hats — public official, corporate co-founder in blind trust, and private thought leader. Ghanaian public-office rules require that these be visibly separated. Today nothing separates them. **Section 12 encodes that separation in software rather than trusting it to memory.**
- 05 The evidence problem.** The Principal's most compelling assets are numbers — an \$8.5 million cross-border portfolio, a \$12 million follow-on grant raised from Japan, a \$17 million World Bank emergency recovery project managed through post-conflict Liberia, a \$40 million country portfolio in Tanzania, water delivered to thirty-six communities, three thousand women's cooperatives organised. None of these are visible anywhere a partner or investor would look. **F02 and F03 turn the CV into evidence.**

1.3 What success looks like

Success is measurable and is defined here so that it can be argued about now rather than after launch.

OUTCOME	MEASURE	TARGET BY MONTH 6
The site becomes the canonical source on the Principal	Share of top-10 Google results for "Ishmael Nii Amanor Dodoo" owned or influenced by the site	≥ 60%
Journalists stop inventing titles	Proportion of new articles using the canonical title string	≥ 75% of articles published after month 3
Speaking requests become managed rather than ad hoc	Qualified requests received through the Protocol Desk	≥ 40 requests, ≥ 90% triaged within 48 hours
Institutional partners self-serve	Press Kit and Speaker Pack downloads	≥ 300
The record becomes legible	Median time on The Atlas (F02) page	≥ 2 min 30 s
Youth engagement converts	Office Hours ballot entries per cycle	≥ 150
Bilingual reach is real, not decorative	French-language sessions as a share of total	≥ 12%
The platform is trusted with sensitive traffic	Confidential enquiries via The Room (F13)	≥ 10, zero security incidents

1.4 What this platform is not

- **It is not a government website.** It must never be mistaken for an official organ of the 24-Hour Economy Authority or the Office of the President. Visual language, domain, footer and disclaimers must all make the separation unmistakable.
- **It is not a CV in HTML.** A digitised résumé is the failure mode this brief is written to prevent. If a page can be replaced by a PDF without loss, that page has failed.
- **It is not a political platform.** The Principal serves under a specific administration. The site must be able to survive a change of government without a rebuild. Nothing partisan. Nothing that dates.
- **It is not a commercial storefront.** There are no products, no courses, no memberships, and no advertising. Any monetisation instinct should be redirected to the Legacy Ledger (F09), which converts attention into scholarships rather than revenue.
- **It is not a personal blog.** The Signal Board (F06) is an instrument of professional foresight, not a diary. The one exception is Selah (F10), which is deliberately, narrowly personal and is quarantined from everything else.

1.5 Non-negotiables

LAUNCH BLOCKERS

The site **must** ship bilingual (English and French) at parity — not machine-translated. The Principal works across francophone West Africa and the Sahel; a monolingual site amputates half his constituency.

The site **must** perform on a 3G connection at under 200 KB for the core reading path. Section 07, F11 specifies how.

The site **must** meet WCAG 2.2 Level AA. Multilateral and government partners increasingly audit for this before linking.

The site **must** publish nothing about live, unannounced government policy. The editorial workflow in Section 12.4 enforces a two-person rule on every publish action.

Every claim on the site **must** be traceable to a named source in the Source Register (Appendix A) or to the Principal's own signed-off copy. No embellishment. His record does not need it.

02 The Subject — Verified Profile

This section is the factual substrate for the entire site. Content producers must treat it as the single source of truth and must not extend it without a verified source. Everything here is drawn either from the Principal's own full curriculum vitae dated 3 September 2025 or from named public reporting listed in Appendix A.

2.1 Canonical identity block

This block is the machine-readable spine of the site. It is defined once, stored once, and rendered everywhere — page titles, structured data, press kit, email signatures and the Protocol Desk correspondence. See **F04**.

FIELD	CANONICAL VALUE	NOTES FOR ENGINEERING
Legal name	Ishmael Nii Amanor Dodoo	Never truncate "Nii Amanor" — these are Ga names, not middle initials.
Honorific	Dr.	Always rendered with the full stop. Doctorate in Public Administration, Adam Smith University (honoris causa, 2017).
Display name	Dr. Ishmael Nii Amanor Dodoo	Use in all formal contexts, all structured data, all press material.
Short display name	Dr. Ishmael Dodoo	Use only where character limits bite — social handles, mobile nav, meta descriptions.
Familiar name	Dr. Ish	Used by the Principal himself and by Green Horizon Ventures. Permitted on Selah (F10) and in youth-facing contexts only.
Pronunciation	ISH-may-el NEE ah-MAH-nor DOH-doo	Ship an audio file recorded by the Principal. This is a real feature, not a flourish.
Primary current title	Chief Partnership Officer, 24-Hour Economy and Accelerated Export Development Programme	Canonical as of July 2026. Version this field — see 2.6.
Long-form title	Director and Head of Innovative Finance, Partnerships and Markets, 24H+ Secretariat, Office of the President, Republic of Ghana	For programmes and formal citations.
Nationality	Ghanaian	Ga heritage; publicly associated with Bukom, Accra.
Languages	English (fluent), French (working-level fluent)	Drives the bilingual requirement and the Protocol Desk language field.
Location	Accra, Ghana	Time zone GMT+0, no daylight saving — matters for the Night Economy toggle (F14).

2.2 The career in four acts

Narrative arcs sell where bullet lists do not. This four-act structure is the recommended spine for the About page (P02) and for the Atlas (F02) timeline.

Act One — The Forest (1998–2008)

A first-class honours degree in Natural Resources Management from KNUST, then five years running the forestry and conservation advocacy unit at the Ghana Wildlife Society — community-based resource management across thirty-six communities in Ghana's Western Region, inside the Upper Guinean Forest Biome. Then Oxford, as a Norman and Ivy Lloyd Africa Fellow at Linacre College, and an MSc in Environmental Change and Management. He stayed in Oxford for

five years at ProForest, building timber-trade standards for the EU FLEGT initiative and helping establish the global Roundtables for Palm Oil and Soy.

The narrative point: he did not start in boardrooms. He started in forests, with communities, counting species. Everything he now says about value chains he learned first at the bottom of one.

Act Two — The System (2008–2018)

Ten years inside the United Nations development system, each posting larger than the last. Post-conflict Liberia, managing a \$17 million World Bank emergency recovery and infrastructure programme. Tanzania, leading strategy and partnerships across a \$40 million country portfolio and chairing an inter-agency working group of ten UN Country Team members. A special assignment as acting Deputy Country Director in Rwanda, where he closed out a fraud investigation and lifted programme delivery by \$3 million in three months. Then New York — country oversight across eighteen programme countries for UNDP's Africa Bureau, the Ebola crisis desk during the 2014–15 emergency, and a secondment into the Executive Office of Secretary-General Ban Ki-moon.

The narrative point: he has sat in the room where the UN system decides what Africa gets. Very few Ghanaians have.

Act Three — The Sahel (2018–2023)

Five years on the hardest development problem on the continent. He built the Office of the Secretary-General's Special Adviser for the Sahel from scratch — hiring, budget, work plan, the lot — and delivered technical support for the UN Sahel Support Plan that became the blueprint for the UN Integrated Strategy for the Sahel across ten countries. Then he ran the Implementation Support Unit, coordinating nineteen UN agencies. Then he built and led the first UN Joint Programme for cross-border cooperation in the Liptako-Gourma — the borderlands of Burkina Faso, Mali and Niger — with eight implementing agencies and an \$8.5 million portfolio, and raised a further \$12 million from Japan through TICAD to scale it.

The narrative point: he does not talk about fragility from a conference stage. He has delivered water, nutrition and jobs into the three most dangerous borders in West Africa.

Act Four — The Return (2023–present)

Co-founder and Executive Vice President of Green Horizon Ventures / CO2 Capital Africa in Kigali — blockchain-based carbon market development, with a designed \$5 million Rwandan trading portfolio including a \$250,000 clean cookstove component across twenty forest catchment communities. Then, from February 2025, home to Ghana and into the Office of the President.

At the 24-Hour Economy Authority he is the commercial front door: partnerships, markets and innovative finance for a programme targeting 1.7 million jobs. Publicly he has set out a \$4 billion mobilisation plan built on blended finance, pension capital and diaspora money — a \$1 billion Value Chain Financing Facility lending to SMEs at concessional rates below ten per cent, a twenty to thirty per cent grant component to de-risk, and special purpose vehicles through the Ghana Infrastructure Investment Fund designed to draw in Africa50, Afreximbank, the African Development Bank and the World Bank.

The narrative point: the arc closes. The man who spent a decade helping the international system decide what Africa should receive is now on the Ghanaian side of the table deciding what Ghana will build.

2.3 The operator's numbers

These figures are the raw material for **F03, The Two Ledgers**. Each must be rendered on the site with its source and its year, and each links back to the relevant Atlas node.

FIGURE	WHAT IT WAS	WHERE / WHEN
\$17 million	World Bank-funded emergency recovery and infrastructure programme, managed end to end	UNDP Liberia, 2008–2010
\$40 million	Country programme portfolio under his strategy, partnerships and quality-assurance leadership	UNDP Tanzania, 2010–2012

FIGURE	WHAT IT WAS	WHERE / WHEN
\$3 million	Additional programme delivery unlocked in three months as acting Deputy Country Director	UNDP Rwanda, 2014
46 countries	African country portfolio covered by his oversight team	UNDP Africa Bureau, 2012–2014
18 countries	Programme countries he personally positioned across development, peace, security and humanitarian files	UNDP Africa Bureau, 2015–2018
\$15 million	Ebola Recovery and Resilience Strategy he designed, funded and implemented — including rice value-chain work with 3,000 women's cooperatives	UNDP / UNMEER, 2014–2015
19 agencies	UN agencies, funds and programmes coordinated across 10 Sahel countries	Implementation Support Unit, 2019–2020
\$15 million	Two operational programmes designed under the UN Sahel Support Plan — climate-resilient agriculture value chains and Sahel renewable energy	OSAS, 2018–2019
\$8.5 million	First UN Joint Programme for cross-border resilience and trade in the Liptako-Gourma, 8 implementing agencies	UN Sahel Joint Programme, 2020–2023
\$12 million	Follow-on grant raised from Japan through TICAD to scale cross-border agricultural trade	TICAD, during 2020–2023
36 communities	Communities given water access under the Joint Programme	Liptako-Gourma
3,000 cooperatives	Women's cooperatives organised across vegetable, dairy, cereal, meat and leather value chains	Liptako-Gourma
10,000 jobs	Vocational jobs created under the Joint Programme	Liptako-Gourma
\$5 million	Carbon credit trading investment portfolio designed for Rwanda, including \$250,000 in cookstoves across 20 forest catchments	CO2 Capital Africa, 2023–2025
\$4 billion	Blended-finance mobilisation plan set out publicly for Ghana's 24-Hour Economy	24H+ Secretariat, 2025
1 of 18	Selected as an African representative among eighteen global young leaders from over six thousand applicants — Distinguished UNDP Lead Fellow	2008

EDITORIAL GUARDRAIL

Every one of these numbers comes from the Principal's own CV or from named public reporting. **No figure may be rounded up, re-denominated, aggregated into a**

FIGURE	WHAT IT WAS	WHERE / WHEN
headline total, or described as "raised" where the CV says "managed". The distinction between money he raised, money he designed, and money he administered is a professional distinction that other development professionals will notice immediately. Getting it wrong would cost more credibility than the number is worth.		

2.4 The public voice — recurring themes

Drawn from verified public reporting between April 2025 and July 2026. These are the Principal's live arguments, and they should structure the Speaking page (P04), the Signal Board (F06) taxonomy, and the Doctrine Engine corpus (F05).

- **Import dependence as a demand argument.** His signature rhetorical move. Ghana imports close to eighty per cent of its essential goods; roughly \$3.5 billion of food and around \$1.5 billion of textiles a year. He inverts the standard critique — a large import bill is not evidence that demand is missing, it is proof that demand already exists and is being met by foreigners. He has cited West Africa's \$27 billion pharmaceutical import market the same way.
- **The 24-Hour Economy is not about working at night.** He has said repeatedly and in different rooms that the policy is about structural transformation, not extended hours, and that three shifts will emerge as an outcome of demand rather than a mandate. Ghanaian factories, he notes, run below forty per cent capacity.
- **Production, not commodity export.** Three pillars — production transformation, market and supply chain efficiency, and skills development. He points to cassava as feedstock for ethanol and starch, and to a domestic fabric industry producing twenty million yards against hundred-million-yard demand.
- **Logistics as the invisible tax.** Nearly \$2 billion a year lost to post-harvest losses, to be attacked through warehousing, cold chains, buffer stock and logistics. The Volta Economic Corridor is his flagship illustration — multi-modal transport moving over 8.2 million tonnes a year across the Volta Lake, positioning Ghana into a \$1.3 trillion West African market.
- **Patient capital and blended finance.** His financing doctrine. Concessional SME lending below ten per cent over three to five years, a twenty to thirty per cent grant layer to de-risk, technical assistance and cooperative credit guarantees, and infrastructure SPVs through the GIFF. In his own framing this is not lending but pipeline-building, governance-strengthening and value-chain alignment.

- **Industrial memory as national confidence.** A distinctive and highly quotable move — he invokes Volta Corned Beef, West Africa's first transistor radios and locally manufactured Sanyo colour televisions to argue that Ghana is not attempting something new but recovering something lost.
- **Youth as the heartbeat.** He calls young people the heartbeat of the 24-Hour Economy ambition and the digital generation who will drive the transformation. This theme is the bridge to F08, Office Hours, and to the Legacy Ledger.
- **Digital transformation as precondition.** Delivered at Ghana Digital and Innovation Week 2025 — online education and finance platforms, smart city and transport systems, and energy for a safe night economy. Without digital transformation, in his framing, the 24-Hour Economy remains an aspiration.
- **Transformation begins with the self.** His most personal register, reported by TransformAfricaNow — anyone who wants to lead Africa's transformation must first transform themselves. This belongs on Selah (F10), not on the policy pages.
- **Origins are not destiny.** "You can come from Bukom and become the best in the world." Delivered at the launch of the GA Youth Forum in October 2025. This line should anchor the youth-facing entry point of the Adaptive Dossier (F01).

2.5 Affiliations and the conflict map

Engineering and content teams must understand this map because it determines what the site may and may not say, and how the Protocol Desk routes requests.

AFFILIATION	NATURE	SITE TREATMENT
24-Hour Economy and Accelerated Export Development Programme / Authority, Office of the President	Current public office	Stated prominently and factually. Site must carry a standing disclaimer that it is a personal platform and does not speak for the Authority or the Government of Ghana. No Authority or Coat of Arms insignia anywhere.
Green Horizon Ventures / CO2 Capital Africa Project Ltd, Kigali	Co-founder and Executive Vice President — held in blind trust	Stated in the historical record with the blind-trust status made explicit and unmissable. No promotional treatment, no live commercial links, no investor-facing material.
Tertiary Education Scholarship Trust (TEST for Africa)	Co-founder — philanthropic	Actively promoted. This is the platform's conversion path (F09).
Oral Roberts University	Doctoral candidate in Strategic Leadership, organisational foresight	Stated. Directly underwrites the credibility of the Signal Board (F06).
Adam Smith University, USA	DPhil in Public Administration, honoris causa (2017)	State plainly and always with "honoris causa" attached. Never imply an earned research doctorate. This is a reputational tripwire and the site must not step on it.
Linacre College, Oxford	Norman and Ivy Lloyd Africa Fellow (2003)	Featured. Genuine, competitive, verifiable.
GA Youth Forum / GaDangme civic life	Community and cultural	Featured in the heritage narrative and in youth-facing routing.
XCreativs Technologies Ltd	Strategic advisor	Not published on this site. Build-team awareness only.

2.6 Source discipline and the versioned-title problem

The Principal's title has changed at least three times in eighteen months, and it will change again. The content model (Section 09) therefore stores titles as a **versioned, date-ranged collection**, not a string. The current title is computed, never hard-coded. This single decision is what makes the Canonical Identity Registry (F04) durable rather than a snapshot that rots.

- Every biographical claim carries a [sourceRef](#) pointing at an entry in the Source Register.

- The Source Register is itself a CMS collection and is rendered publicly at </record/sources> — an unusual move that signals confidence and gives journalists somewhere to land.
- Any claim without a [sourceRef](#) fails the publish validation and cannot go live. This is enforced in code, not in process.

03 Positioning and Narrative Strategy

3.1 The positioning statement

POSITIONING

Dr. Ishmael Nii Amanor Dodoo is the rare African leader who has stood on both sides of the development table — inside the United Nations system deciding how the world engages Africa, and now inside the Office of the President deciding how Africa engages the world.

He does not theorise about structural transformation. He has financed it, coordinated it across nineteen agencies and ten fragile states, and is now building it at home.

The one-line version, for meta descriptions and social cards: *From the Sahel to the Office of the President — twenty-five years turning development finance into things that actually get built.*

3.2 The five audiences

These five segments drive **F01, the Adaptive Dossier**. Each has a different question, a different proof set, and a different call to action. The homepage must be able to become five different homepages.

AUDIENCE	THE QUESTION THEY ARRIVE WITH	PROOF THAT ANSWERS IT	PRIMARY CTA
Government and multilateral (ministries, IFIs, UN, AU, ECOWAS)	"Can this man convene and deliver across institutions that do not like each other?"	The Sahel record: 19 agencies, 10 countries, 8-agency Joint Programme, the UN Sahel Support Plan	Request a closed-door briefing (The Room, F13)
Capital and investors (DFIs, funds, pension capital, diaspora)	"Is there a credible, de-risked pipeline in Ghana and who structures it?"	The \$4 billion blended-finance architecture, the VCFF, the GIIF SPVs, the carbon-markets work	Request a confidential conversation (F13)
Conference and media (organisers, producers, editors)	"Will he show up, is he good on stage, and what exactly do I put in the programme?"	Speech archive with video, the canonical title registry, the auto-generated Speaker Pack	Protocol Desk booking (Section 08) or Press Kit
Youth and talent (students, early-career professionals)	"How did someone from Bukom end up in the Secretary-General's office?"	The four-act arc, the Lead Fellow selection, "You can come from Bukom", Salah	Office Hours ballot (F08)
Diaspora and philanthropy	"Where can I put money or effort so that it lands?"	TEST for Africa, the scholarship record, the community work in the Western Region	Legacy Ledger (F09)

3.3 Message architecture

The core claim

He builds the machinery that turns declared intentions into delivered outcomes. That is the through-line from forest communities in the Western Region to a \$4 billion financing architecture, and every page should be traceable back to it.

Three supporting pillars

— **Pillar one — Convening power.** He gets institutions that do not naturally cooperate to move together. Proof: 19 UN agencies coordinated; an 8-agency Joint Programme built from nothing; a 10-member inter-agency HACT working group chaired; the Ebola L3 crisis board secretariat.

- **Pillar two — Financial architecture.** He designs the structures that let capital reach places it usually refuses to go. Proof: the \$1 billion VCFF design; concessional terms with a de-risking grant layer; GIIF SPVs; \$12 million raised from TICAD; a \$5 million carbon portfolio.
- **Pillar three — Ground truth.** He has delivered physical outcomes in genuinely hard places. Proof: water to 36 communities in the Liptako-Gourma; a \$17 million infrastructure programme in post-conflict Liberia; the Ebola Recovery and Resilience Strategy; 36 communities of resource management in the Western Region.

Nine proof points — the rotating evidence set

The homepage hero carries a rotating proof strip. These nine are the approved set; no others may be added without content sign-off. Each links to its Atlas node.

- 19 UN agencies coordinated across 10 Sahel countries
- \$8.5m cross-border programme built in the Liptako-Gourma
- \$12m raised from Japan to scale it
- Secretary-General's Executive Office, New York
- Ebola crisis desk, UNDP Africa Bureau, 2014–15
- \$17m World Bank recovery programme, post-conflict Liberia
- 1 of 18 global Lead Fellows from 6,000+ applicants
- Oxford — Lloyd Africa Fellow, Linacre College
- Now: the commercial architecture of Ghana's 24-Hour Economy

3.4 Tone of voice

DO	DON'T
Write in plain, load-bearing sentences. The record does the work.	Reach for "visionary", "thought leader", "trailblazer", "world-class".
Use exact figures with their year and source.	Round up, aggregate, or say "over \$100 million in projects".
Say what he did, then what changed because of it.	Describe responsibilities without outcomes.
Name the hard places: Liptako-Gourma, Monrovia, the Sahel border.	Say "challenging environments" or "emerging markets".
Let institutional names carry the weight: UNDP, UNMEER, OSAS, TICAD, GIIF.	Explain the UN system to people who already know it.
Keep the Ga and Ghanaian register where it is his own voice.	Manufacture folksiness or perform Africanness.
Use the present tense for present roles and the past tense for past ones — and let the CMS enforce it.	Leave stale "currently" statements to rot on the page.

3.5 Naming and title governance

One rule, enforced in code: **no title string is ever written into a template, a component, an email or a translation file.**

All titles resolve from the identity registry at render time. When the Principal is promoted or moves, one CMS edit updates the site, the press kit, the structured data, the PDF generator and every outgoing email in both languages. This is F04 and it is the least glamorous, highest-value feature in the build.

04 Experience and Art Direction

4.1 Design principle — statecraft, not startup

The visual register is that of a national institution or a serious publication, not a founder's landing page. Think the design language of an annual report from a central bank crossed with a long-form magazine feature. Generous white space, unhurried typography, a strict grid, almost no colour, and photography that is documentary rather than corporate.

- **Restraint reads as power.** The temptation with a record like this is to shout. Do the opposite. A single number set in large type against white space is more persuasive than a wall of achievements.
- **Editorial, not promotional.** Pages should feel written and edited, not marketed. Long measure, real paragraphs, pull quotes, footnotes, sources.
- **Documentary photography.** Field images over studio portraits wherever the archive allows — the Sahel, Liberia, community meetings, factory floors, the Volta corridor. The Principal in rooms, not against backdrops.
- **No stock imagery, ever.** A single generic handshake photograph would undo the entire positioning. If an approved image does not exist, use typography.

4.2 Colour system

TOKEN	VALUE	ROLE
--ink	#111318	Primary text, headlines. Near-black, never pure black.
--paper	#FBFAF8	Page background. Warm off-white, not #FFFFFF — reduces glare and reads as printed.
--accent	#0B4F6C	Primary accent. A deep institutional teal-blue. Links, active states, section rules.
--accent-deep	#062F41	Hover and pressed states, dark surfaces.
--gold	#B08D3F	Restricted. Used only for the Legacy Ledger (F09) and honours. Never for navigation or buttons.
--sahel	#C1663B	Restricted. The Atlas (F02) uses it for the Sahel-era nodes only.
--muted	#5B6472	Secondary text, captions, metadata.
--rule	#E2DED7	Hairlines and dividers.
--surface	#F2EFEA	Cards, callouts, quiet panels.
--night-ink	#E8E6E1	Text in Night Economy mode (F14).
--night-paper	#0E1114	Background in Night Economy mode.
--signal	#2E7D5B	Confirmed / accepted states in the Protocol Desk only.
--caution	#8C3A2E	Declined / conflict states in the Protocol Desk only.

Every colour must be defined as a CSS custom property in a single [tokens.css](#) and must never be hard-coded in a component. Both light and Night Economy palettes are declared in the same file behind a [\[data-theme\]](#) attribute.

4.3 Typography

- **Display and headline.** A high-contrast serif with authority and a slightly editorial character. Recommended: **GT Sectra**, **Freight Display**, or the open licence alternative **Newsreader**. Weights 400 and 600 only.
- **Body.** A neutral, highly legible sans with excellent Latin Extended coverage for French. Recommended: **Inter Tight** or **Söhne**. Weights 400, 500, 600.

- **Data and code.** A monospace used for figures in the Atlas and Two Ledgers, and for all timestamps. Recommended: **JetBrains Mono** or **IBM Plex Mono**.
- **Type scale.** A modular scale at 1.25 from a 17px body base. Headline sizes must be fluid using `clamp()` — do not ship fixed breakpoint jumps.
- **Measure.** Body copy is capped at 68 characters. This is a hard rule; long measure is the fastest way to make an editorial site feel amateur.
- **French typography.** Non-breaking spaces before `;` `!` `?` and French guillemets « » in the French locale. This is handled at the content-render layer, not by translators. Getting this wrong marks the site as translated rather than bilingual — precisely the impression to avoid.

Font loading budget: no more than four font files total, all subset, all `woff2`, all `font-display: swap`, all self-hosted. Zero third-party font requests — Google Fonts is prohibited for both performance and jurisdictional-privacy reasons.

4.4 Layout and grid

- Twelve-column grid, 1280px maximum content width, 72px gutters on desktop and 20px on mobile.
- An asymmetric editorial grid is preferred over centred columns — body text on columns 2–8, marginalia, sources and pull quotes on 9–12. This alone will differentiate the site from every other personal site in the sector.
- Vertical rhythm on an 8px baseline. Every spacing token is a multiple of 8.
- Breakpoints at 480, 768, 1024, 1280 and 1600. Design mobile-first; a large share of Ghanaian and Sahel traffic will be Android on mobile data.

4.5 Photography and imagery direction

- **Portraiture.** One definitive portrait, shot properly — three-quarter, natural light, dark suit, neutral ground, direct gaze. Retouched minimally. This image becomes the press-kit primary and must be shot new; the current CV headshot is not adequate for the hero.
- **Field archive.** Solicit the Principal's own archive from Liberia, Tanzania, Rwanda, Dakar, New York and the Liptako-Gourma. Even low-resolution images are usable if treated deliberately — duotone, small format, heavily captioned. Authenticity beats resolution here.
- **Treatment.** A single consistent treatment across all field images — a subtle duotone in `--ink` and `--paper`, which unifies a mismatched archive and looks intentional.
- **Captions are mandatory.** Every image carries place, year and context. Uncaptioned photography on a site like this reads as decoration.
- **The Bukom thread.** Commission one short photo essay on Bukom and Ga Accra to anchor the origin narrative. This should be genuinely good — a working photographer, not a phone.

4.6 Motion

- **Motion is functional only.** Transitions clarify state changes. There are no decorative animations, no parallax and no scroll-jacking anywhere on this site.
- **Durations.** 160ms for micro-interactions, 240ms for panel transitions, 400ms maximum for the Atlas camera moves. Easing `cubic-bezier(0.22, 1, 0.36, 1)`.
- **`prefers-reduced-motion`.** Fully honoured. The Atlas must be completely operable and legible with all motion disabled — build the static fallback first and layer motion on top.
- **The one indulgence.** The Atlas globe-to-timeline transition (F02). It is permitted to be beautiful because it is the single most persuasive moment on the site.

4.7 Accessibility — WCAG 2.2 Level AA

- All text meets 4.5:1 contrast; large text 3:1. Verified in CI with axe-core, not by eye.
- Every interactive element is keyboard operable with a visible focus ring of at least 2px in `--accent`.

- The Atlas must have a fully equivalent tabular view at [/record/table](#) — not a degraded fallback but a genuine alternative that some users will prefer.
- All video carries captions in both languages and a downloadable transcript.
- Form errors are announced through [aria-live](#), associated with their fields, and written in plain language.
- The pronunciation audio (2.1) has a visible text guide alongside it.
- Target sizes of at least 24 by 24 CSS pixels throughout, per WCAG 2.2 success criterion 2.5.8.

4.8 Night Economy mode (F14)

The dark theme is not an afterthought toggle; it is a piece of storytelling. The site follows Accra local time and shifts to Night Economy mode after 18:00 GMT, with a visible, persistent manual override. A single quiet line in the footer explains it: *This site keeps Accra hours*. It is a small thing that will be noticed and repeated, and it does the positioning work of a paragraph without writing one.

05 Information Architecture

5.1 Sitemap

CODE	PAGE	PATH (EN)	PURPOSE	PRIORITY
P01	Home	/	Adaptive entry point. Establishes authority in under five seconds and routes the visitor by audience.	Must

—	Legal	/legal/privacy, /legal/terms, /legal/disclosure	Privacy, terms, and the public-office disclosure statement.	Must

5.2 Navigation model

— **Primary navigation carries five items only.** The Record · Speaking · Signals · Press · Contact. Everything else is reached contextually. Five is the ceiling; a navigation bar with nine items announces that the site does not know what it is for.

- **The Adaptive Dossier does not change the navigation.** F01 re-sequences homepage content and adjusts calls to action. It must never hide navigation or create the impression of a personalised maze. Users must always be able to see the whole site.
- **A persistent utility bar.** language toggle (EN/FR), Night Economy toggle, search, and the Sahel Mode switch. Right-aligned, small, always available.
- Breadcrumbs on every page below the first level, marked up with [BreadcrumbList](#) structured data.
- **The booking call to action is persistent.** A single quiet "Request an engagement" affordance is present on every page except Selah, where it would be tonally wrong.

5.3 URL scheme

- French mirrors English under a locale prefix: [/fr/record](#) maps to [/record](#). Every page has a counterpart; there are no orphan locales.
- Atlas nodes are individually addressable and shareable: [/record/atlas/liptako-gourma](#), [/record/atlas/unmeer-ebola](#).
- Signals use dated slugs: [/signals/2026/07/import-bill-is-a-demand-signal](#).
- Archive items: [/archive/2025/ghana-digital-innovation-week-keynote](#).
- All URLs lowercase, hyphenated, no trailing slash, no dates in page paths outside Signals and Archive.
- Permanent 301s from any legacy or vanity domains to the canonical host.

5.4 Bilingual structure

French is a first-class citizen of this build, not a translation layer bolted on at the end. The Principal spent five years working out of Dakar across francophone West Africa, and the Sahel constituency that gives his record its weight reads French first.

- Locale routing via Next.js middleware with [Accept-Language](#) detection on first visit and a persisted cookie thereafter. Detection must never override an explicit user choice.
- Hreflang tags on every page, reciprocal and self-referential, plus an [x-default](#) pointing at the English root.
- Translation is human. A named professional translator with development-sector vocabulary is a line item in the budget (Section 16). Machine translation is not acceptable and will be immediately visible to exactly the audience the site is trying to impress.
- Every CMS document carries both locales in the same document with per-field translation status, so an editor can see at a glance what is out of sync. A page whose French is stale must display a dated notice rather than silently serving old content.
- The Protocol Desk (Section 08) operates fully in both languages, including all automated correspondence and the generated PDFs.

SECTION SIX

06 Page-by-Page Specification

Each page below is specified as: purpose, the sections it contains in order, the components it needs, its calls to action, and its edge states. Designers should treat the section order as a strong recommendation and the content requirements as binding.

P01 — Home

Purpose. Establish that the visitor is dealing with someone consequential within five seconds, then route them by intent without making them think. The homepage is the only page permitted to change shape by audience.

Sections in order

- 01 The declaration.** Full-viewport, typographic, almost no image. The Principal's name at display scale, the canonical title beneath it resolved from the identity registry, and one sentence of positioning. Below it, a single thin rule and the rotating nine-point proof strip from Section 3.3. No carousel, no video background, no scroll indicator.
- 02 The five doors.** The Adaptive Dossier entry (F01). Five plain typographic panels, each posing the audience's own question back to them — "You need someone who can convene institutions." / "You are looking for structured, de-risked pipeline in Ghana." / "You are building a programme and need a speaker." / "You want to know how someone gets from Bukom to the Secretary-General's office." / "You want to fund a scholar." Selecting one re-sequences everything below and persists for the session.
- 03 The record in brief.** Four cards, one per act. Each carries a date range, a place, one figure and one sentence. Links into P02 and the corresponding Atlas node.
- 04 The Atlas preview.** A live but non-interactive still of the Atlas with a node count — "A record across 36 countries" — and a single link. Do not embed the interactive Atlas on the homepage; it will cost the performance budget and dilute the moment.
- 05 Current position.** A restrained block on the 24-Hour Economy work, written in the third person, carrying the standing disclaimer that this is a personal site. One figure (\$4 billion mobilisation architecture), one link out to Speaking.
- 06 The latest signal.** The most recent Signal Board entry, rendered in full if under 200 words. This makes the homepage feel alive without a news feed.
- 07 The invitation.** A single, quiet engagement call to action, adapted by the selected door. Never more than one CTA in this block.

Edge states

- No audience selected — default sequence is the general one; the five doors remain visible and are never dismissed permanently.
- No published signal — the block collapses entirely rather than showing a placeholder.
- JavaScript disabled — the full default homepage renders server-side; the doors become plain anchor links to filtered views.

P02 — The Record (narrative)

Purpose. The long-form biography, written as a magazine profile rather than a résumé. This is the page that converts a sceptic. Target length 2,200–2,800 words in each language.

- Structure follows the four acts in Section 2.2, each opening with a full-width duotone field image and a dateline.
- Marginalia column carries figures, source references and small archival images — the asymmetric grid from 4.4 earns its keep here.
- Pull quotes are drawn only from the Principal's own verified public statements, each with venue and date.
- A persistent right-hand progress rail shows the four acts and current position — useful on a page this long.
- Every factual claim carries a superscript reference resolving to [/record/sources](#).
- Closing block: the Two Ledgers toggle (F03) as the transition into the evidence layer.

P03 — The Atlas

Purpose. Make twenty-five years legible in ninety seconds. Full specification at **F02**. Page-level requirements below.

- Two synchronised views — a map and a timeline — sharing one selection state. Selecting a node in either highlights it in the other.
- Filters: era, institution, thematic area (crisis response, financing, coordination, policy, environment), and portfolio scale.

- Every node opens a detail panel: place, years, role, portfolio value, what was delivered, source reference, and any archival image.
- Deep-linkable and shareable at node level; the shared link opens with that node selected and the camera positioned.
- A prominent, non-apologetic link to the equivalent table view for accessibility and for users who simply prefer data.

P04 — Speaking

Purpose. Convince a programme director within one screen that booking him is both desirable and low-risk, then hand them to the Protocol Desk.

Sections in order

- 01 What he speaks about.** Six defined keynote themes, each with a title, a 60-word abstract, the audiences it suits, and two past platforms where he has delivered it. Draft themes are supplied in Appendix C.
- 02 Formats and what each requires.** Keynote, plenary panel, fireside, closed-door institutional briefing, media interview, academic lecture, youth address. Each with typical duration, ideal audience size, and lead time required. This transparency is unusual and it materially reduces unsuitable requests.
- 03 Where he has spoken.** A restrained logo-free list — event name, venue, city, date, and a link to the archive item where one exists. Text beats logos here; logos will make the page look like a sponsorship deck.
- 04 Watch and read.** Three to five embedded video excerpts with captions, plus transcript links into P09.
- 05 What organisers receive.** A plain list of what the Protocol Desk returns — confirmation within 48 hours, a Speaker Pack with approved bios and portraits, a technical and protocol rider, and a named point of contact. Reliability is the product here.
- 06 Request an engagement.** The single call to action into P05.

P05 — The Protocol Desk

The full specification is Section 08. At page level: a multi-step form with saved progress, no account required, a visible step indicator, a plain-language summary before submission, and an immediate reference number on completion. It must be completable on a mobile phone in under four minutes.

P06 — Signal Board

Purpose. Turn the Principal's doctoral specialism — organisational foresight — into a visible, dated, accountable public practice. Full specification at **F06**.

- Each signal is 150–250 words, dated to the minute, tagged, and permanently addressable.
- Each carries a confidence marker the Principal sets himself: *Watching*, *Expecting*, or *Calling it*.
- A companion Foresight Ledger lists past calls with their outcomes, marked *Held up*, *Partly*, *Did not*, or *Too early*. This is the feature that will get the site talked about, and it is also the one that requires courage to ship.
- Signals are publishable from mobile by the Principal alone, but the two-person publish rule in 12.4 applies to any signal tagged with a policy area.

P07 — Press Room

Purpose. Make it effortless for a journalist under deadline to get the Principal right. Full specification at **F04**.

- Canonical name, honorific and current title, presented as one-click copyable strings.
- Pronunciation audio with written guide.
- Biographies at 40, 120 and 300 words in both languages, each individually copyable.
- Portrait set: three approved images at web and print resolution with usage terms and photographer credit.
- Title history — the versioned register, publicly visible. A journalist writing about an event in 2025 can see what his title was at that time. Nobody else in Ghana does this.

- A Press Kit generator that assembles a branded PDF or ZIP with everything above, personalised with the requesting outlet's name and the date of generation. Requires only an email and outlet name — no gate, no approval delay.
- A media contact route that reaches the Principal's designated point of contact rather than the general inbox.

P08 — The Doctrine

Purpose. Let a visitor ask what the Principal thinks about something and receive an answer built strictly from what he has actually said, with citations. Full specification and guardrails at **F05**. This is the highest-risk feature in the build and the section on its constraints is not optional reading.

P09 — The Archive

Purpose. Every speech, interview and published remark in one searchable place, with transcripts, so that quotation is accurate. Full specification at **F12**.

- Filterable by year, venue, theme, language and format.
- Full-text search across transcripts, not just titles.
- Any passage can be selected and copied as a formatted citation with venue and date attached.
- Video items carry chapter markers, so a producer can jump to the thirty seconds they need.

P10 — Legacy

Purpose. Convert reputation into scholarships. Full specification at **F09**. The page tells the story of the Tertiary Education Scholarship Trust, shows the running count of scholars supported, profiles named beneficiaries with their consent, and offers three clear paths: fund a scholar, mentor a scholar, or refer a candidate.

P11 — Office Hours

Purpose. Handle the volume of young people who want his time in a way that is generous, honest and finite. Full specification at **F08**.

P12 — Selah

Purpose. One page where the Principal is a person rather than an office. He signs his own posts with *Selah*; the page takes its name from that. Deliberately minimal: no navigation chrome beyond a single return link, no images, no calls to action, no analytics events beyond a page view, a single column of text set large. Short reflections on leadership, faith and becoming. Nothing else on the site should look like this page, and that is the point.

P13 — Contact and The Room

- General enquiries route to a monitored inbox with a published response window.
- Media enquiries route to the press contact.
- Speaking enquiries are redirected to the Protocol Desk with a short explanation of why.
- The Room (F13) is a separate, clearly-marked confidential channel for institutional and investment conversations, with end-to-end encrypted submission and a restricted-access inbox.

07 The Signature Layer — Fifteen Features

This is the section that separates the build from a competent portfolio site. Each feature below is specified as: what it is, the problem it solves, how it works, what it costs to build, and where it can go wrong. Effort is given in ideal engineering days.

CODE	FEATURE	PRIORITY	EFFORT	RISK
F01	The Adaptive Dossier	Must	8	Low
F02	The Atlas	Must	18	Medium
F03	The Two Ledgers	Must	5	Low
F04	Canonical Identity Registry and Press Kit Generator	Must	10	Low
F05	The Doctrine Engine	Should	20	High
F06	Signal Board and Foresight Ledger	Should	9	Medium
F07	The Protocol Desk	Must	25	Medium
F08	Office Hours Ballot	Should	8	Low
F09	The Legacy Ledger	Should	10	Medium
F10	Selah	May	2	Low
F11	Sahel Mode	Must	6	Low
F12	The Quotable Archive	Should	12	Low
F13	The Room	Must	9	High
F14	Night Economy Mode	Should	3	Low
F15	The Living Dossier	Should	7	Medium

F01 — The Adaptive Dossier

What it is. The homepage asks the visitor, in plain language, what they came for. Five doors, five re-sequenced experiences, one site.

The problem. The Principal is five different propositions to five different audiences. A ministry cares about convening power; a fund cares about pipeline; a conference cares about reliability; a student cares about the path; a donor cares about impact. A single homepage optimised for all of them is optimised for none.

How it works

- Selection is stored in a first-party cookie and in [localStorage](#), scoped to the session with a 30-day persistence and an always-visible reset.
- Selection changes: the order of homepage blocks, the proof points shown in the strip, the primary CTA, and the default filter applied when the visitor reaches the Atlas.
- It does **not** change: the navigation, the availability of any page, or the factual content of any claim. There is one site and one truth; only emphasis moves.
- Server-rendered per variant with [Cache-Control: private](#) on the personalised shell and public caching on all shared fragments. Do not client-render the hero — it will cost the Largest Contentful Paint budget.
- A [?door=investor](#) query parameter allows the Principal to share a pre-routed link into a specific framing. This turns out to be the most-used part of the feature in practice.

WHERE IT GOES WRONG

Personalisation that hides things feels manipulative and will damage exactly the trust this site exists to build. The rule is absolute: **re-sequence, never conceal**. If a QA test finds any content reachable in one door and unreachable in another, that is a defect.

F02 — The Atlas

What it is. An interactive map and timeline of a twenty-five year career across thirty-six countries — every posting, every portfolio, every outcome, positioned in space and time.

The problem. The Principal's record is genuinely extraordinary but it is currently stored as a list of job titles, which is the least persuasive format ever invented. Geography and scale are what make it land: Monrovia in 2008, Dar es Salaam in 2010, New York in 2015, Dakar in 2019, the Burkina–Mali–Niger tri-border in 2021, Kigali in 2023, Accra in 2025. Seen on a map, the arc is self-evident.

How it works

- 01 Data.** A CMS collection of [atlasNode](#) documents (schema in Section 09). Roughly 45–60 nodes at launch: postings, programmes, missions, and named deliverables.
- 02 Map layer.** A vector base map rendered with MapLibre GL and a self-hosted, heavily-styled tile set — no third-party map branding, no default styling. The map is monochrome in [--ink](#) and [--paper](#) with nodes in [--accent](#) and Sahel-era nodes in [--sahel](#).
- 03 Timeline layer.** A horizontally scrollable band beneath the map, 1998 to present, with node markers positioned by date and sized by portfolio value. Scrubbing the timeline flies the map camera; clicking a map node scrolls the timeline. One shared selection state, two representations.
- 04 Detail panel.** Slides in from the right on desktop, full-screen sheet on mobile. Carries role, institution, dates, portfolio value, three to five delivered outcomes, archival image, source reference, and links to related archive items.
- 05 Filtering.** Era, institution, theme and scale, applied to both layers simultaneously with an animated transition. Filters are reflected in the URL so a filtered view is shareable.
- 06 The reveal.** On first load, an optional 20-second guided sequence walks the four acts automatically, then hands control to the user. Skippable, never auto-replayed, and disabled entirely under [prefers-reduced-motion](#).
- 07 The table twin.** [/record/atlas/table](#) renders the identical dataset as a sortable, filterable table. This is the accessibility route and also, for a subset of institutional users, the preferred one.

Build notes

- Budget the map bundle carefully — MapLibre plus tiles must be lazy-loaded and must not appear in the initial route bundle. Target: interactive within 2.5 s on a mid-range Android over 4G.
- Under Sahel Mode (F11), the Atlas serves the table twin by default with an explicit opt-in to load the map.
- Node coordinates must be reviewed by the Principal. Some postings are regional rather than city-specific and must be represented as regions, not pins — misplacing a Sahel posting is the kind of error a Sahel specialist will notice instantly.
- Portfolio values must render with their currency, year and a source marker. Never animate a number counting up; it makes real figures look invented.

F03 — The Two Ledgers

What it is. One toggle, two readings of the same life. *The Diplomatic Record* presents institutions, mandates and appointments in formal register. *The Operator's Record* presents the same career as portfolio values, agencies coordinated, communities reached and money raised.

The problem. A UN peer and a private investor are impressed by completely different framings of identical facts, and neither is impressed by the other's. Rather than compromise into something that persuades no one, show both and let the visitor choose. The toggle itself makes a point: this is a man fluent in two languages that rarely meet.

- Both ledgers derive from the same [atlasNode](#) and [role](#) data. There is no duplicate content to maintain — the difference is entirely in the projection.
- The toggle state is shared with F01: selecting the investor or government door pre-selects the corresponding ledger.
- Rendered as a single component reused on P02, P03 and the homepage record-in-brief block.
- Print stylesheet: printing either ledger produces a clean two-page document. Institutional users print things.

F04 — Canonical Identity Registry and Press Kit Generator

What it is. A single authoritative record of who the Principal is, what he is called, and what he has been called — surfaced publicly, consumed internally by every other feature, and packaged on demand into a press kit.

The problem. Documented in Section 1.2. Five job titles in eighteen months across credible outlets, and no source of truth for a journalist to check.

How it works

- 01 The registry.** A CMS singleton holding the identity block from Section 2.1 plus a [titleHistory](#) array of date-ranged title records. The current title is computed from the date, never stored as a duplicate.
- 02 Internal consumption.** Every template, email, PDF, structured-data block and translation file resolves titles from the registry at render time. Grep the codebase before launch: any hard-coded title string is a build failure.
- 03 Public surface.** The Press Room renders each canonical string in a copy-on-click field with a small confirmation. Journalists copy; they do not retype.
- 04 Title history, published.** A dated table of every title he has held with the Authority and previously. A reporter writing about an April 2025 event gets the April 2025 title. This is a small piece of institutional generosity that buys enormous goodwill.
- 05 Press Kit generator.** On request — name, outlet, email — the system assembles a branded PDF and a ZIP. The PDF is generated server-side from the live registry so it can never be stale, and is watermarked with the outlet name and generation date. Delivery is immediate; a copy of the request is logged for the Principal's records.
- 06 Pronunciation.** Audio recorded by the Principal, served as a small [audio](#) element with a written guide and a [speechToText](#) fallback label.

WHY THIS IS THE HIGHEST-VALUE FEATURE IN THE BUILD

It is unglamorous, it will not be in anyone's portfolio, and it will do more for the Principal's public standing over three years than the Atlas will. Consistency of name and title is how institutional reputation compounds. Build it first.

F05 — The Doctrine Engine

What it is. A question-answering interface, grounded strictly in the Principal's own published words, that answers "what does he think about X?" with citations to the specific speech, interview or paper and its date.

The problem. Journalists, organisers and researchers routinely need his position on something. Today they either guess, or they email and wait. A grounded, cited answering layer serves them in seconds and — critically — pushes them towards his actual words rather than a paraphrase.

How it works

- 01 The corpus.** A closed, curated set. Approved speech transcripts, published interviews, the Signal Board, and position statements the Principal has personally signed off. Nothing scraped. Nothing inferred. Each document carries date, venue, language and an approval record.

- 02 Retrieval.** Chunked at paragraph level, embedded, stored in Postgres with [pgvector](#). Hybrid retrieval — dense vectors plus BM25 keyword — because policy questions frequently hinge on exact terms like "VCFF" or "Liptako-Gourma" that dense retrieval alone handles poorly.
- 03 Generation.** The Claude API, constrained by a system prompt that permits **only** synthesis of retrieved passages. Every sentence in an answer must be attributable to a retrieved chunk, and the interface renders the citation inline with venue and date.
- 04 The refusal boundary.** This is the load-bearing part. The engine must decline, in a specific and non-apologetic way, whenever: retrieval confidence falls below threshold; the question concerns unannounced or live government policy; the question asks for a prediction, endorsement, or opinion he has not publicly given; the question concerns any named individual; or the question is about party politics. The decline message routes the user to the Protocol Desk or the press contact.
- 05 Human oversight.** Every question and answer is logged. The Principal or his designate reviews a weekly digest. Any answer can be retracted, and retraction invalidates the cached response immediately.
- 06 The disclosure.** A permanent, unmissable notice on the interface — this tool retrieves and summarises statements he has already made in public; it is not him, it does not speak for him, and it does not speak for the Government of Ghana.

RISK ASSESSMENT — READ BEFORE BUILDING

This feature carries the highest risk in the specification. A senior public official whose website appears to generate novel policy positions is a genuine institutional hazard, and one bad answer screenshotted onto social media would cost more than the feature is worth.

Therefore: **F05 does not ship until F04, F07 and F12 are live and stable, and it ships behind an explicit written authorisation from the Principal.** Build it last. Launch it quietly. Consider a two-week invite-only period with the Principal reviewing every exchange before opening it publicly.

If the Principal is not comfortable with it, ship P08 as a curated "Positions" page instead — the same questions, answered with hand-written, signed-off responses. Ninety per cent of the value, none of the risk.

F06 — The Signal Board and the Foresight Ledger

What it is. Short, dated, tagged foresight notes on African political economy — and a public ledger scoring how his previous calls turned out.

The problem. Thought leadership is cheap because it is unfalsifiable. Everyone publishes opinions; nobody publishes a scorecard. The Principal is a doctoral candidate in organisational foresight — he is uniquely positioned to make the strongest possible credibility move in this space, which is to be publicly accountable for his own calls.

How it works

- **Signal format.** 150–250 words. A dateline to the minute. One to three tags. A confidence marker — *Watching*, *Expecting*, or *Calling it*. A "what would change my mind" line, which is optional but strongly encouraged and is the detail that will make readers take the whole thing seriously.
- **The Ledger.** Any signal marked *Expecting* or *Calling it* enters the Foresight Ledger with a review date. On that date it is resolved as *Held up*, *Partly*, *Did not*, or *Too early*, with a two-sentence note. Resolutions are permanent and cannot be deleted — only annotated.
- **The counter.** The Ledger displays a running record. Yes, including the misses. A visible "Did not" with an honest note will do more for his credibility than nine hits.
- **Publishing.** Mobile-first authoring so the Principal can publish from a phone between meetings. A signal tagged with any policy area routes through the two-person approval in 12.4 before going live.
- **Distribution.** RSS, JSON Feed, an email digest, and a one-tap share card generated server-side as an image with the signal text, date and confidence marker. The share card is what will actually travel.

A NOTE ON COURAGE

The Foresight Ledger only works if the misses stay up. If there is any prospect of quiet deletions, do not build the Ledger — build the Signal Board alone. A scorecard that only shows wins is worse than no scorecard, and readers in this sector will notice within one cycle.

F07 — The Protocol Desk

Specified in full in **Section 08**, which is the longest section of this document because it is the feature the Principal will use most.

F08 — Office Hours Ballot

What it is. A monthly ballot. Young Africans submit a single question of up to 300 characters. A small number are drawn and receive a twenty-minute video conversation. Every drawn question and its answer is published to a public archive.

The problem. The Principal says young people are the heartbeat of the transformation, and he means it — but the demand for his time is unbounded and his supply is not. The choice is between a vague open invitation that he cannot honour and an honest, finite mechanism that he can. The second is more generous even though it looks smaller.

- **Cycle.** Opens on the first of each month, closes on the tenth, draw on the twelfth, sessions in the last week. Entirely automated; no manual gate.
- **Entry.** Name, country, one question, one sentence on why. No CV upload, no LinkedIn, no gatekeeping. Deliberately low-friction.
- **The draw.** Weighted randomisation, not editorial selection. Weighting favours entrants who have never been drawn and, modestly, entrants from countries outside Ghana. The weighting rules are published on the page — an unusual level of transparency that removes any suggestion of favouritism.
- **The archive.** Every session produces a published question and a written answer, with the entrant credited if they consent. Over a year this becomes a genuinely valuable corpus and a strong feed into F05.
- **Not drawn.** Every unsuccessful entrant receives an honest message — not a rejection, a re-entry. Their entry rolls into the next cycle automatically with increased weight, and they are told so.

F09 — The Legacy Ledger

What it is. The public engine for the Tertiary Education Scholarship Trust, which the Principal co-founded — a running ledger of scholars supported, and three clear ways to contribute.

- **The count.** Scholars supported to date, currently studying, and graduated. Sourced from the Trust, updated by the Trust's designated administrator through a restricted CMS role.
- **Named scholars.** Short profiles with photographs, published only with written consent and reviewable by the scholar at any time. Consent status is a required field and a profile without it cannot render.
- **Three paths.** Fund a scholar (a defined annual amount, handled by the Trust's own payment infrastructure — this site does not process donations directly), mentor a scholar, or refer a candidate.
- **The separation.** The Trust is a distinct legal entity. This site links to it, tells its story, and routes to it. It does not take money on its behalf. This keeps the site out of the regulatory perimeter of charitable fundraising in every jurisdiction it reaches.
- The --gold token is used here and only here.

F10 — Selah

What it is. One page, deliberately unlike everything else. Reflections in the Principal's own voice on leadership, faith and becoming — the register in which he already writes when he is speaking for himself.

- No navigation beyond a single return link. No calls to action. No sharing buttons. No related content. No images.

- One column, large type, generous leading, --paper background, --ink text. Nothing else.
- Analytics limited to a page view. No scroll depth, no engagement tracking. Instrumenting this page would violate what it is for.
- Two days of build effort. It will be, for a meaningful number of visitors, the page they remember.

F11 — Sahel Mode

What it is. A genuine low-bandwidth twin of the site: text-first, image-light, under 200 KB for any page, functional on 2G.

The problem — and why this is a positioning feature, not a charity feature. The Principal's constituency includes Burkina Faso, Mali, Niger, Chad and Mauritania, and Sierra Leone connectivity is a live constraint in the region he works in. A site about African development that only works on European broadband refutes its own argument. Building for the Sahel is the most on-message technical decision available in this project.

- **Trigger.** Automatic via the Network Information API where available (effectiveType of 2g or slow-2g, or saveData set), with a persistent manual toggle in the utility bar and a ?lite=1 parameter.
- **What changes.** Images drop to compressed placeholders with alt text and a tap-to-load control. The Atlas serves the table twin. Video becomes a transcript with a link. Fonts fall back to system stacks. Non-critical JavaScript is not sent at all.
- **What does not change.** Every word of content, every page, every form. The Protocol Desk must be fully completable in Sahel Mode — this is a hard requirement and a QA gate.
- **The statement.** A single line on the toggle — *Built to work on a Sahel connection*. Say it once, plainly, and let it sit there.

F12 — The Quotable Archive

What it is. Every speech, interview and public remark, transcribed, searchable, and structured so that quoting him accurately is easier than quoting him badly.

- **Ingestion.** Transcripts produced by machine transcription then human-corrected. Uncorrected transcripts are marked as such and are excluded from the F05 corpus.
- **Search.** Full-text across transcripts in both languages, with results showing the surrounding sentence and a jump-to-timestamp link for video items.
- **Citation copy.** Selecting any passage surfaces a small control that copies the quotation together with speaker, venue, city, date and URL, pre-formatted. Offer three formats — plain, house-style journalistic, and an academic citation.
- **Chapters.** Video items carry chapter markers so a producer can extract the thirty seconds they need without watching forty minutes.
- **Correction log.** Where the Principal has been misquoted in public and has issued a correction, the archive records it. This is a small, quietly powerful feature.

F13 — The Room

What it is. A confidential channel for institutional and investment conversations that should not pass through a general contact form.

- Submissions are encrypted in the browser to a public key before transmission; the server stores ciphertext only and cannot read the contents. Decryption happens in a restricted admin client.
- No submission content is ever written to application logs, error reports, analytics, or email bodies. Notification emails carry a reference number and nothing else.
- Access is limited to the Principal and at most one designate, protected by hardware-key two-factor authentication.
- Retention is 180 days by default with explicit extension, and a documented deletion path.

- The page states plainly what the channel is for and, equally plainly, what it is not for: it is not a channel for procurement, tender or contract discussions relating to the 24-Hour Economy Authority. Section 12.2 explains why that sentence is non-negotiable.

F14 — Night Economy Mode

Specified in 4.8. Three days of effort for a piece of storytelling that costs nothing to maintain and will be mentioned in every article written about the site.

F15 — The Living Dossier

What it is. A server-generated PDF of the Principal's full record, assembled live from the CMS at the moment of request, personalised to the requester and their purpose.

- **Three variants.** the Speaker Pack (for organisers), the Institutional Dossier (for governments and IFIs), and the Full Record (everything).
- **Personalised.** The cover carries the requesting organisation and the generation date. Not gimmickry — an organiser circulating it internally is far more likely to keep a document with their own event on the cover.
- **Always current.** Because it is generated from live data, there is no stale PDF in circulation. This is the structural fix for the problem described in Section 1.1.
- **Typeset properly.** Generated with a headless browser against a dedicated print stylesheet, not assembled by a PDF library. It must be good enough to print and hand to a minister.
- **Watermarked and logged.** Each generation carries a discreet reference, and the request is recorded. If a version leaks or is altered, its origin is traceable.

08 The Protocol Desk — Engagement Booking System

IN SHORT

The Protocol Desk is the operational heart of this platform. It replaces LinkedIn messages, WhatsApp forwards and third-party intermediaries with a single, auditable, bilingual intake that screens for suitability, checks for institutional conflict, generates a protocol note, holds a calendar slot, and answers every requester within forty-eight hours whether the answer is yes or no.

It is designed to feel like being received by a protocol officer, not like filling in a form.

8.1 Design philosophy

- **It screens rather than collects.** A general contact form maximises submissions. The Protocol Desk maximises *suitable* submissions. Every question it asks is a question that either helps the Principal decide or helps the requester self-select out.
- **It answers everyone.** Including declines. A conference organiser who receives a clear, prompt, courteous no will invite him again next year. One who receives silence will not, and will tell colleagues.
- **It is honest about capacity.** The page states plainly that the Principal receives more requests than he can accept and that a decline is not a judgement of the event. This single paragraph will reduce follow-up chasing dramatically.
- **It protects the office.** The capacity question in 8.4 is not administrative tidiness. It is a compliance control, and it is the first substantive question the form asks.
- **It works on a phone in Ouagadougou.** Four minutes, low bandwidth, no account, saved progress, no file upload required at the intake stage.

8.2 Engagement types

TYPE	TYPICAL DURATION	MINIMUM LEAD TIME	ROUTING
Keynote address	25–45 min	8 weeks	Full intake, capacity check, fee logic
Plenary or panel participation	45–90 min	5 weeks	Full intake, capacity check
Fireside conversation / armchair interview	30–60 min	5 weeks	Full intake, moderator details required
Closed-door institutional briefing	60–120 min	6 weeks	Escalated — routed to the Principal directly, Chatham House status required
Media interview (broadcast, print, podcast)	15–60 min	2 weeks	Routed to the press contact, not the Principal
Advisory or board engagement	Ongoing	10 weeks	Escalated — mandatory conflict review before any response
Academic lecture or seminar	45–90 min	8 weeks	Full intake, host institution verification
Youth or student address	20–45 min	4 weeks	Fast-tracked, fee logic suppressed, prioritised
Written contribution (foreword, op-ed, chapter)	n/a	6 weeks	Full intake plus editorial review flag

8.3 The intake flow

Six steps, each on its own screen, with a visible progress indicator and saved state. Fields marked required are enforced client and server side.

Step 1 — Capacity

Deliberately first. The answer determines everything downstream, including whether the request is even eligible.

- Question: *In what capacity are you inviting Dr. Dodoo?* Options: (a) In his official role at the 24-Hour Economy Authority; (b) In his personal capacity as a development and finance practitioner; (c) I am not sure.
- Selecting (a) surfaces an immediate notice that official-capacity invitations must also be addressed to the Authority through its own channels, with a link, and that this Desk will forward but cannot confirm on the Authority's behalf.
- Selecting (c) is common and entirely fine. The Desk asks two clarifying questions and classifies on the requester's behalf.
- This answer sets the **capacity** field, which drives conflict screening (8.5), fee logic (8.9) and the wording of every subsequent message.

Step 2 — The organisation

- Organisation name (required), type (government / multilateral / private sector / academic / civil society / media / other), country (required), website, and the requester's name, role and email (all required).
- Domain verification: where the requester's email domain matches the stated organisation website, the request is auto-flagged *Verified*. Where it does not — a personal email address for a ministry request, for example — it is flagged *Unverified* for manual review. This is a lightweight but surprisingly effective filter against impersonation.
- A single free-text field: *Who else is involved in convening this?* Sponsors, co-hosts and partners are exactly what the conflict screen needs, and asking directly is better than discovering later.

Step 3 — The engagement

- Engagement type from 8.2 (required). Event name, date or date range, city and country, venue.
- Format: in person, virtual, or hybrid. Where in person, the system computes travel implications from Accra and displays them to the requester, which quietly manages expectations about lead time.
- Language of the engagement: English, French, or both. Where French is selected, the system notes that the Principal presents in French at working level and asks whether interpretation will be provided.
- Expected audience size and a short description of who will be in the room. *Seniority matters more than headcount* is stated on the form — a closed room of twelve ministers outranks an auditorium of six hundred, and requesters should be told this so they answer usefully.
- Is this a recurring or first-time event? Which edition?

Step 4 — The ask

- The proposed theme or title, and — in up to 200 words — *what you want the audience to leave with*. This framing produces far better answers than "describe your event".
- A theme-matching hint: as the requester types, the interface suggests the closest of the Principal's six defined speaking themes (P04) and notes which past delivery it resembles. Helpful, and it subtly steers requests towards the material he is strongest on.
- Who else is speaking? Confirmed or invited.
- Will the session be recorded, broadcast or published? If yes, a permissions block appears covering recording, transcript rights and republication, which resolves a question that otherwise surfaces awkwardly two days before the event.

Step 5 — Logistics and protocol

- Travel and accommodation arrangements: covered by host / not covered / to be discussed.
- Honorarium: offered / not offered / to be discussed. See 8.9 for how this interacts with capacity.

- Protocol requirements: is a formal invitation letter required? Is a visa letter required? Is diplomatic or government protocol involved? Will other principals or heads of state be present?
- Security considerations, if any.
- A named on-the-ground point of contact with a phone number.

Step 6 — Review and submit

- A plain-language summary of the entire request, rendered as prose rather than as a field dump — *"You are inviting Dr. Dodoo to deliver a 30-minute keynote in his personal capacity at the ... on ... in Nairobi, to an audience of approximately 200 senior..."* — with an edit link on each element. Requesters catch their own errors when they read prose; they do not catch them when they scan a table.
- Explicit consent checkboxes: data processing (linked to the privacy notice) and confirmation of authority to invite on the organisation's behalf.
- On submit: an immediate on-screen reference number in the format [PD-2026-0417](#), and an acknowledgement email within sixty seconds in the requester's language.

8.4 The capacity switch and the Article 284 firewall

COMPLIANCE REQUIREMENT — NOT OPTIONAL

The Principal holds public office in Ghana. Article 284 of the 1992 Constitution prohibits a public officer from putting themselves in a position where their personal interest conflicts with the performance of their official duties. This platform is a personal platform belonging to a serving public official, and that fact must be engineered into the system rather than left to judgement in the moment.

Concretely, the Protocol Desk implements the following controls:

- 01** Capacity is captured before anything else and is immutable once the request is submitted — changing it requires a new request, so that the record shows what was actually asked.
- 02** Any request in official capacity is automatically accompanied by a forwarding notice to the Authority's own channel and is never confirmed by this Desk.
- 03** Any request from an organisation that is a current or prospective counterparty of the Authority — supplier, bidder, grantee, financing partner — is flagged by the conflict screen (8.5) and cannot be auto-progressed. It requires an explicit human decision recorded with a reason.
- 04** Honorarium logic is suppressed entirely for any official-capacity request. The field does not render. It is not possible to record an offer of payment against an official-capacity engagement through this system.
- 05** The Room (F13) carries an explicit statement that it is not a channel for procurement or tender discussions, and its intake form contains no fields that could be used to conduct one.
- 06** Every request, decision and reason is retained as an immutable audit record. If the Principal is ever asked to account for how a speaking engagement came about, the answer is a complete, timestamped record rather than a search through WhatsApp.

Engineering note: these controls are implemented in the domain layer, not in the user interface. A request that violates them must be rejected by the API even if a client somehow submits it.

8.5 Screening and triage

Every submitted request is scored automatically on five dimensions. The score never decides anything — it orders the queue and surfaces what a human should look at first.

DIMENSION	WHAT IS ASSESSED	WEIGHT
Institutional weight	Type and standing of the convening organisation; seniority of the audience; presence of other principals	30%

DIMENSION	WHAT IS ASSESSED	WEIGHT
Thematic fit	Match to the six defined speaking themes and to the Principal's live agenda	25%
Strategic value	Geography (Sahel, francophone West Africa and Sierra Leone weighted up), relevance to 24H+ partnership objectives where in official capacity, and diaspora or investor reach	20%
Feasibility	Lead time against the minimum for that engagement type; travel from Accra; existing calendar commitments	15%
Completeness and verification	Domain verification status; completeness of the ask; whether a named contact was supplied	10%

Automatic flags

- **Conflict flag.** The requesting organisation, or any named co-convenor, appears on the maintained counterparty watch list. Blocks auto-progression.
- **Lead-time flag.** Below the minimum for the engagement type. Does not block; surfaces prominently.
- **Unverified flag.** Email domain does not match the stated organisation.
- **Clash flag.** The date conflicts with an existing hold or confirmed engagement.
- **Sensitivity flag.** Free-text fields match a maintained term list covering party politics, active litigation, live procurement, and named individuals. Routes to human review before any automated response is sent.
- **Repeat-requester flag.** The organisation has previously invited him. Prior outcome is displayed inline — context that is invaluable and currently lives only in memory.

8.6 The Protocol Note

For every request that clears initial screening, the system generates a one-page internal briefing document — the Protocol Note — and delivers it to the Principal as a PDF and as a mobile-readable summary.

- The ask, in three lines.
- Who is convening, what they are, and any prior relationship with the Principal or with the Authority.
- Capacity classification and any conflict flags, stated first and stated plainly.
- Audience composition and seniority.
- The recommendation from the triage engine and the score, with the two factors that drove it.
- Calendar position: what is either side of it, and what travel it implies.
- A single decision control — Accept, Decline, Hold, or Request more information — actionable from the email itself via a signed one-time link. The Principal must be able to decide from a phone between meetings, because that is when he will actually do it.

8.7 Request lifecycle

STATE	MEANING	AUTOMATIC TRANSITIONS	REQUESTER NOTIFIED
RECEIVED	Submitted and acknowledged	→ SCREENED on completion of automated screening (under 60 s)	Yes — immediate acknowledgement with reference
SCREENED	Scored and flagged; Protocol Note generated	→ AWAITING_DECISION	No
AWAITING_DECISION	With the Principal or designate	Escalation reminder at 24 h and 40 h	Yes — at 48 h, a status update if undecided

STATE	MEANING	AUTOMATIC TRANSITIONS	REQUESTER NOTIFIED
INFO_REQUESTED	Clarification sought from the requester	→ AWAITING_DECISION on reply; → LAPSED after 14 days	Yes
HELD	Provisional calendar hold placed	Auto-expires after 21 days unless confirmed	Yes — with the hold expiry date stated
ACCEPTED	Confirmed in principle	→ CONTRACTED once the rider and letter are exchanged	Yes — with the Speaker Pack attached
CONTRACTED	Rider agreed, logistics fixed	→ DELIVERED after the event date	Yes
DELIVERED	Engagement completed	→ ARCHIVED after follow-up	Yes — thank-you and materials request
DECLINED	Not proceeding	Terminal	Yes — always, with a reason category
LAPSED	No response from requester	Terminal	Yes — one final notice before lapsing

8.8 Calendar and holds

- Two-way synchronisation with the Principal's calendar over CalDAV or the Microsoft Graph API, depending on his environment. Confirm during discovery.
- Holds are written as tentative entries with the reference number in the subject, so that the calendar itself is legible without opening the system.
- Availability is never published. The Desk must not expose a public booking calendar — that would be inappropriate for someone in his position and would invite abuse.
- A blackout collection in the CMS lets the Principal mark periods as unavailable in one action. Requests landing in a blackout are auto-flagged, not auto-declined.
- Travel buffers are computed automatically: a minimum of 24 hours either side of any intercontinental engagement, 12 hours for regional.

8.9 The Speaker Rider

Generated automatically on acceptance, in both languages, from a CMS-managed template with per-engagement overrides. Sections:

- Biography and title to be used — pulled from the identity registry (F04), so the programme cannot get it wrong.
- Approved portrait, with credit and usage terms.
- Technical requirements: microphone preference, presentation format, display requirements, whether a lectern is needed.
- Timing: arrival, briefing window, rehearsal requirement.
- Travel and accommodation standard, where covered by the host.
- Recording, transcript and republication permissions as agreed at intake.
- Honorarium terms, rendered only for personal-capacity engagements and suppressed entirely otherwise.
- Protocol requirements: invitation letter, visa support letter, and the correct form of address.
- Named point of contact on both sides.

8.10 Automated correspondence

Nine templates, all bilingual, all rendering identity fields from F04, all reviewed and signed off by the Principal before launch. Draft copy is in Appendix C.

TEMPLATE	TRIGGER	TONE
Acknowledgement	On submission	Immediate, specific, warm. States the 48-hour window.
Status update	48 h without decision	Honest — the request is being considered and by when.
Information request	On INFO_REQUESTED	Specific about what is missing and why it matters.
Hold placed	On HELD	Clear that a hold is not a confirmation; states the expiry date.
Acceptance	On ACCEPTED	Gracious, with the Speaker Pack and rider attached and next steps enumerated.
Decline — capacity	On DECLINED (diary)	Genuinely regretful, explicit that it is diary not merit, invites a future approach.
Decline — fit	On DECLINED (fit)	Courteous and brief. Suggests the Press Room or the Doctrine page as an alternative.
Decline — conflict	On DECLINED (conflict)	Formal and precise. States that the engagement cannot proceed for reasons of public-office conflict.
Follow-up	3 days after DELIVERED	Thanks, requests recording and photographs for the archive, invites feedback.

8.11 The admin console

- A queue view ordered by triage score with flags rendered as colour-coded chips.
- A calendar view showing holds, confirmations and blackouts together.
- An organisation view: every past interaction with a given body, in one place.
- Bulk actions on lapsed and expired requests only. Never bulk-decline; every decline is individual.
- A full immutable audit trail per request — who saw it, when, what they did, and why.
- An analytics view: request volume by month, geography, type and outcome; acceptance rate; median decision time. This is what the Principal will look at when deciding how much of his year to give to speaking.
- Two roles: Principal (all actions) and Desk Officer (all actions except final accept and decline).

8.12 Data model — core tables

TABLE	KEY FIELDS
engagement_request	id, reference, state, capacity, engagement_type, event_name, event_start, event_end, city, country, format, language, audience_size, audience_description, theme, objective, recording_permissions, honorarium_status, travel_status, triage_score, created_at, locale
requester	id, name, role, email, phone, organisation_id, domain_verified, consent_at, consent_version
organisation	id, name, type, country, website, counterparty_status, notes, first_seen, last_seen
request_flag	id, request_id, flag_type, severity, detail, raised_at, cleared_at, cleared_by, clearance_reason
request_event	id, request_id, from_state, to_state, actor_id, actor_role, reason, occurred_at — append-only, never updated or deleted
calendar_hold	id, request_id, starts_at, ends_at, external_event_id, expires_at, released_at
blackout	id, starts_at, ends_at, reason, created_by
counterparty_watch	id, organisation_name, match_pattern, basis, added_by, added_at, review_due
correspondence	id, request_id, template, locale, sent_at, provider_message_id, delivery_status

8.13 Acceptance criteria

- A complete request can be submitted on a mid-range Android device over a throttled 3G connection in under four minutes, in both languages, in Sahel Mode.
- An official-capacity request cannot, under any code path including direct API calls, record an honorarium.
- A request naming a watch-listed organisation cannot transition to **ACCEPTED** without a recorded human clearance carrying a reason string.
- Every state transition writes an immutable `request_event` row. Deleting or updating such a row is prevented at the database level.
- Every requester in every terminal state has received exactly one appropriate final message, in their submitted language.
- The Protocol Note reaches the Principal within five minutes of screening completion and its decision links work from a mobile email client without a session.
- Median automated screening time under sixty seconds at a load of one hundred concurrent submissions.

09 Content Model

The CMS is Sanity. Schemas below are the minimum; fields may be added but none may be removed without a content sign-off. Every localised field is an object keyed by locale with a per-field translation status of [current](#), [stale](#) or [missing](#).

DOCUMENT TYPE	CARDINALITY	KEY FIELDS
identity	Singleton	legalName , honorific , displayName , shortName , familiarName , pronunciationAudio , pronunciationGuide , nationality , languages[] , location , titleHistory[] (each: title , organisation , from , to , sourceRef), bio40 , bio120 , bio300 (all localised), portraits[]
atlasNode	45–60	slug , label , institution , role , country , city , coordinates or region , startDate , endDate , era , themes[] , portfolioValue , currency , valueYear , valueType (managed / raised / designed), outcomes[] , image , sourceRef[] , relatedArchive[]
speakingTheme	6	title , abstract , audiences[] , pastDeliveries[] , relatedNodes[] , videoExcerpt — all localised
signal	Growing	slug , body (150–250 words), publishedAt , tags[] , confidence (watching / expecting / callingIt), changeMyMind , reviewDue , resolution (heldUp / partly / didNot / tooEarly), resolutionNote , resolvedAt , approvedBy
archiveItem	Growing	slug , title , type (speech / interview / panel / article / broadcast), venue , city , country , date , language , mediaUrl , transcript , transcriptStatus (machine / corrected), chapters[] , corrections[] , approvedForDoctrine (boolean)
source	Growing	ref , title , publisher , url , accessedAt , type (cv / press / official / firstParty), notes
scholar	Growing	name , country , institution , field , cohortYear , status , photo , story , consentStatus , consentDate — record cannot render without consentStatus = granted
officeHoursCycle	Monthly	opensAt , closesAt , drawAt , slotCount , entries[] , drawn[] , weightingRules
officeHoursAnswer	Growing	question , entrantName , entrantCountry , answer , publishedAt , entrantConsent
selahEntry	Growing	body , publishedAt — no tags, no images, no related content by design
riderTemplate	Singleton	All rider sections as localised rich text with per-engagement override support
emailTemplate	9	key , subject , body — localised, with named variable slots resolved from identity
page	13	slug , title , metaDescription , ogImage , blocks[] , noindex
blackout / counterparty	Operational	Mirrors the Protocol Desk tables; managed by the Desk Officer role

9.1 Validation rules enforced at publish

- Any [atlasNode](#) with a [portfolioValue](#) must have a [valueType](#) and at least one [sourceRef](#). No exceptions.
- Any biographical claim field must carry a [sourceRef](#).
- A [scholar](#) without [consentStatus](#) = granted cannot be published and does not appear in any API response.
- A [signal](#) tagged with any policy term requires [approvedBy](#) to differ from the author (the two-person rule, 12.4).
- A [signal](#) with [confidence](#) other than [watching](#) requires a [reviewDue](#) date.
- An [archiveItem](#) with [transcriptStatus](#) = machine cannot have [approvedForDoctrine](#) = true.
- A document whose French translation status is [stale](#) renders a dated notice on the French locale rather than serving silently out-of-date content.

10 Technical Architecture

10.1 Stack

LAYER	CHOICE	RATIONALE
Framework	Next.js 15, App Router, TypeScript strict	Server components give the performance budget headroom; built-in i18n routing; strong static and dynamic mix suits a site that is mostly content with a few stateful features.
Styling	Tailwind CSS with a bespoke token layer; no component library on public pages	The art direction in Section 04 is deliberately unlike anything a component library ships with. Component libraries are permitted in the admin console only.
CMS	Sanity	Structured content, real-time collaboration, strong localisation support, and a query language that suits the Atlas and identity registry well.
Database	PostgreSQL with pgvector	Protocol Desk transactional data and the Doctrine Engine embeddings in one system. Do not add a separate vector database for this volume.
ORM	Drizzle	Explicit SQL, typed, and readable in migrations — which matters for an audit-sensitive schema.
Auth (admin)	Auth.js with WebAuthn hardware keys mandatory for the Principal and Desk Officer	Passwords alone are not adequate for an account that can act on behalf of a public official.
Email	Resend, with a dedicated authenticated sending subdomain	Deliverability into government and multilateral mail systems is the requirement that drives this choice. SPF, DKIM and DMARC must all be configured at launch, not after.
Maps	MapLibre GL with self-hosted vector tiles	No third-party attribution or branding; full styling control; no external request on a key page.
AI	Claude API (F05 only), server-side, never client-side	API keys never reach the browser. Every call is proxied, rate-limited and logged.
PDF	Headless Chromium against a dedicated print stylesheet	Produces documents good enough to print and hand over. PDF libraries do not.
Hosting	Vercel for the application, Cloudflare in front for WAF, caching and bot management	Edge presence matters for African latency. Confirm the nearest edge coverage for Accra, Lagos, Nairobi and Dakar during discovery.
Media	Cloudflare R2 or Sanity CDN with responsive transformation	Egress cost and image weight are both material given the audience.
Observability	Grafana with Prometheus metrics, Loki for logs, Opsgenie for on-call	Matches the XCreativs house stack; the team already knows it.
Analytics	Plausible, self-hosted	No cookie banner, no personal data, and a jurisdictional position that is defensible when the site belongs to a public official.

10.2 System shape

- The public site is statically generated where possible and incrementally revalidated on CMS webhook. Only the Adaptive Dossier shell, the Protocol Desk, the Doctrine Engine and The Room are dynamic.
- The Protocol Desk is a distinct bounded context with its own schema, its own service layer and its own authorisation rules. It shares nothing with the CMS beyond reading the identity registry.
- The Doctrine Engine is a separate service behind an internal API. If it fails, the rest of the site is unaffected and P08 degrades to a static positions page.

- The Room writes only ciphertext and shares no infrastructure with the Protocol Desk beyond the database instance, with a separate schema and separate credentials.
- All outbound integrations are behind an adapter interface with a defined failure mode. No third-party outage may take the site down.

10.3 Environments and delivery

- Three environments — local, preview (one per pull request), and production. Preview environments must be password-protected; an indexable preview of an unreleased site about a public official is a genuine hazard.
- Trunk-based development with short-lived branches. Pull requests require one approving review and a green pipeline.
- CI runs: TypeScript, ESLint, Prettier, unit tests, Playwright end-to-end tests, axe-core accessibility checks, Lighthouse budgets, and a grep gate that fails the build on any hard-coded title string.
- Database migrations are versioned, forward-only, and reviewed separately from application code.
- Content and code deploy independently. A content change must never require a deployment.

10.4 Performance budgets — enforced in CI

METRIC	BUDGET	APPLIES TO
Largest Contentful Paint	≤ 1.8 s on Moto G Power / 4G	All pages
Interaction to Next Paint	≤ 150 ms	All pages
Cumulative Layout Shift	≤ 0.05	All pages
Initial JavaScript	≤ 120 KB compressed	All pages except P03
Total page weight	≤ 500 KB	All pages except P03
Total page weight — Sahel Mode	≤ 200 KB	Every page without exception
Atlas time to interactive	≤ 2.5 s on 4G	P03
Lighthouse Accessibility	100	All pages

11 Integrations

INTEGRATION	PURPOSE	FAILURE MODE
Calendar — CalDAV or Microsoft Graph	Two-way sync of holds and confirmations	Queue writes and retry; never lose a hold. Surface a banner in the console if sync is degraded.
Resend	All transactional correspondence	Queue with exponential backoff; alert on-call after two failed attempts; never silently drop a decline.
Claude API	Doctrine Engine only (F05)	P08 degrades to the static positions page. No user-visible error.
Sanity webhooks	Content revalidation	Fall back to a 60-minute time-based revalidation.
Video hosting	Speech excerpts on P04 and P09	Self-hosted via Cloudflare Stream preferred. If YouTube is used, embeds must be privacy-enhanced and lazy-loaded via a facade.
TEST for Africa	Scholar counts and giving links (F09)	Manual CMS entry with a stated "as at" date. Do not build an API dependency on a small charity's systems.
Video conferencing	Office Hours sessions (F08)	Generated links only; no recording integration. Sessions are not recorded by default.
Cloudflare Turnstile	Bot protection on all public forms	Never block a legitimate submission — fail open to a manual review queue rather than rejecting.
Plausible (self-hosted)	Analytics	Analytics failure is invisible to users and non-blocking.
Opsgenie	On-call alerting	Secondary email alerting to the delivery lead.

12 Security, Privacy and Public-Office Compliance

12.1 Threat model

This is not a generic brochure site and it must not be threat-modelled as one. The Principal is a serving senior official in the Office of the President of Ghana with an international network across ministries, multilaterals and development finance institutions. That makes this platform a target of a specific kind.

THREAT	WHY IT APPLIES HERE	CONTROL
Impersonation of the Principal	A convincing fake booking confirmation or invitation letter carrying his name could extract money or credentials from a conference organiser or a ministry	F04 canonical registry; all outbound mail DKIM-signed from one authenticated subdomain; every generated document carries a verifiable reference; a published statement of exactly which channels are official
Phishing of requesters	Requesters submit organisational contact details and travel plans — valuable to an attacker	Minimal data collection; no travel detail stored beyond what is needed; encryption at rest; strict retention
Harvesting of the Principal's network	The organisation table effectively maps his institutional relationships	Admin-only access with hardware-key 2FA; no public API; rate limiting; no organisation data in any client bundle
Defacement or content injection	Any political content appearing on a presidential adviser's personal site is a national story within hours	Two-person publish rule; immutable content audit log; instant rollback; WAF; strict Content Security Policy
Prompt injection against F05	A crafted question could attempt to make the engine produce a policy statement he never made	Retrieval-only generation; strict refusal boundary; full logging; human review; the engine cannot generate any sentence not attributable to a retrieved chunk
Exposure of confidential enquiries	The Room may carry genuinely sensitive institutional conversations	Client-side encryption to a public key; ciphertext-only storage; no content in logs, alerts or emails; 180-day default retention
Denial of service around a news event	Traffic will spike sharply when he is in the news	Static generation plus Cloudflare caching; the site must survive a hundredfold spike without the Protocol Desk degrading

12.2 The public-office firewall

Described operationally in 8.4. At platform level, three additional requirements:

- **Visual and legal separation.** Every page footer carries, in both languages: *This is the personal website of Dr. Ishmael Nii Amanor Dadoo. It is not an official publication of the 24-Hour Economy and Accelerated Export Development Authority, the Office of the President, or the Government of Ghana.* No national insignia, no Coat of Arms, no Authority logo, and no colour scheme that could be mistaken for a government site.
- **Disclosure page.** [/legal/disclosure](#) sets out his current public office, his blind-trust interest in Green Horizon Ventures / CO2 Capital Africa, his co-founding role at the Tertiary Education Scholarship Trust, and how engagement requests are handled. Publishing this proactively is unusual, and it is precisely the kind of thing that protects him.
- **No commercial surface.** No advertising, no sponsorship, no affiliate links, no paid placements, and no third-party commercial logos anywhere on the platform.

12.3 Data protection

- The platform processes personal data of requesters, ballot entrants and scholars. It must comply with Ghana's Data Protection Act, 2012 (Act 843) and, because a substantial share of requesters will be in the EU, with the GDPR.
- Register with Ghana's Data Protection Commission before launch. This is a legal precondition, not a formality, and it has a lead time — start it in week one.
- Lawful basis: legitimate interest for handling engagement requests; consent for the ballot, the newsletter and scholar profiles. Consent version and timestamp are stored per record.

- Data minimisation: collect nothing the triage engine or the correspondence does not use. Review every field in Section 8.3 against this test before build.
- Retention: engagement requests 36 months (they are institutional memory and have genuine value); The Room 180 days by default; ballot entries 12 months; analytics aggregate only, indefinite.
- Subject access and erasure: a documented process with a named owner and a 30-day service level. Erasure must not break the immutable audit trail — pseudonymise the personal fields and retain the state history.
- All data at rest encrypted; all transport TLS 1.3; no personal data in logs, error tracking or analytics.

12.4 Editorial control — the two-person rule

- Any content tagged with a policy area requires an approver different from the author before it can publish. Enforced in the CMS, not by convention.
- The Principal may publish to Selah and to untagged Signals alone. Everything touching policy, finance or the Authority requires the second pair of eyes.
- Every publish, unpublish and edit writes an immutable audit entry with actor, timestamp and diff.
- One-click rollback to any previous published version, available to the Principal from a mobile device.
- A documented takedown procedure with a fifteen-minute target from decision to content being unreachable.

12.5 Access control

ROLE	CAN	CANNOT
Principal	Everything, including final accept and decline, and access to The Room	—
Desk Officer	Triage, request information, place holds, manage blackouts and the counterparty list, send correspondence	Final accept or decline; open The Room; edit the identity registry
Editor	Draft and approve content, publish untagged content	Publish policy-tagged content alone; access the Protocol Desk; access The Room
Press Officer	Manage the press room, portraits and bios; view press-kit requests	Publish signals; access the Protocol Desk
Trust Administrator	Manage scholar records and counts	Anything outside the Legacy collection
Engineer	Deploy, view system logs and metrics	Read request content, Room content, or personal data in production

12.6 Incident response

- A named incident owner and a documented runbook covering: defacement, credential compromise, a bad Doctrine Engine answer, a mistaken publish, and a data exposure.
- Severity 1 — anything with political or reputational exposure — pages the on-call engineer through Opsgenie and notifies the Principal directly within fifteen minutes.
- A pre-drafted holding statement exists for a content incident, approved in advance. Drafting one under pressure is how small incidents become large ones.
- Post-incident review within five working days, written up and retained.

13 Discoverability and the Knowledge Graph

13.1 The disambiguation problem

This is the most important discoverability work in the project and it is not conventional search engine optimisation. Search results for the Principal are currently contaminated by at least two other prominent Ghanaians who appear in overlapping policy conversations: **Dr. Ishmael Yamson**, a member of Ghana's Presidential Advisory Group on the Economy, and **Professor Francis Dadoo** of AFIDEP. Both speak on African transformation. Both are quoted in the same outlets. The first names and surnames overlap.

The consequence is that a portion of the Principal's reputational equity is being attributed elsewhere, and that AI answer engines — which now mediate a growing share of first impressions — are learning a blurred entity.

The remedy

- 01 Own the entity.** Publish complete [Person](#) structured data on every page, with [givenName](#), [additionalName](#) ("Nii Amanor"), [familyName](#), [honorificPrefix](#), [jobTitle](#) resolved from the identity registry, [worksFor](#), [alumniOf](#) (KNUST, University of Oxford), [nationality](#), [knowsLanguage](#), [knowsAbout](#), and a complete [sameAs](#) array.
- 02 Build the `sameAs` graph.** LinkedIn, the Authority's own page where one exists, Green Horizon Ventures, verified social profiles, and — critically — a Wikidata item. Create and maintain the Wikidata entry with a proper description that distinguishes him. Wikidata is the substrate most knowledge panels and several AI systems draw from, and almost nobody in Ghana claims theirs.
- 03 Disambiguate explicitly.** The Press Room carries a short, factual "not to be confused with" note. This looks small and it is disproportionately effective — it gives both search engines and human editors an explicit signal.
- 04 Publish `Iims.txt`.** A plain-text file at the domain root summarising who he is, his canonical title, his principal affiliations and the URLs of the authoritative pages. AI answer engines increasingly read this. It costs an hour and it is the single highest-leverage hour in the SEO workflow.
- 05 Consistent citation everywhere.** Every appearance of the name across the site, every generated PDF, every email signature and every structured data block uses the identical canonical string from F04. Consistency is what teaches a knowledge graph that an entity is one person.
- 06 Earn the inbound links.** The Foresight Ledger (F06) and the published Source Register are both the kind of thing that gets linked to by people who write about African policy. That is the deliberate strategy — the unusual features are also the link-earning features.

13.2 Structured data inventory

SCHEMA TYPE	WHERE	NOTES
Person	Sitewide, in the root layout	The canonical entity definition. One source, rendered everywhere.
ProfilePage	P02	Marks the record as the authoritative profile of the entity.
BreadcrumbList	All pages below level one	—
Event / EventSeries	P04 past platforms, P09 archive items	Improves the odds of appearing in event-related surfaces.
Article / Opinion	P06 signals	With datePublished , author and about .
VideoObject	P09 video items	With transcript, chapters and duration.
FAQPage	P07 press room	The canonical answers to the questions journalists actually ask.
Organization	P10 Legacy	For the Trust, clearly marked as a separate entity.

13.3 Technical hygiene

- Self-referential canonicals on every page. Reciprocal hreflang with [x-default](#). No canonical pointing across locales.
- XML sitemaps per locale, with an index, submitted to Google and Bing Search Console.
- [robots.txt](#) permits reputable AI crawlers deliberately — the objective is for AI systems to learn him correctly, not to be excluded from them.
- Open Graph and Twitter cards generated server-side per page, with the identity registry supplying name and title. Signal share cards are generated as images at publish time.
- No [noindex](#) anywhere except preview environments and [/legal/](#)* where appropriate.
- Core Web Vitals monitored in the field through the Chrome UX Report, not only in the lab.

14 Measurement

Measure what changes decisions. A dashboard nobody acts on is a cost, not an asset. The Principal should be able to answer three questions monthly: is my record reaching the right people, is the Desk working, and is the youth pipeline alive.

QUESTION	METRIC	INSTRUMENTED WHERE
Is the record reaching the right people?	Sessions by country and referrer class (government / multilateral / media / academic domains where identifiable); Atlas engagement depth; Living Dossier generations by organisation type	P01, P02, P03, F15
Is the Desk working?	Requests received, triage time, decision time, acceptance rate, decline reason distribution, requester language split, abandonment rate by intake step	P05 / Section 08
Where do requests stall?	Step-level drop-off in the six-step intake, with time-on-step	P05
Is the press problem fixed?	Press Kit generations; copy-to-clipboard events per canonical field; share of new coverage using the canonical title (manual monthly audit)	P07 / F04
Is the youth pipeline alive?	Ballot entries per cycle; repeat entrants; countries represented; Office Hours archive readership	P11 / F08
Is the foresight practice credible?	Signal readership; Ledger page views; resolution rate against review dates; inbound links to signals	P06 / F06
Is bilingual reach real?	French sessions as a share of total; French-language request share; French content staleness	Sitewide
Is the low-bandwidth investment justified?	Sahel Mode sessions; completion rate of the Protocol Desk in Sahel Mode	F11

Reporting cadence. An automated monthly digest to the Principal — one page, plain language, three questions answered, no charts he did not ask for. A quarterly review with the Product Lead covering what to build next.

15 Content and Asset Inventory

The single largest schedule risk on a project of this kind is not engineering — it is waiting on content from a very busy principal. Everything below should be requested in week one, with a named owner and a date, and chased weekly.

ASSET	OWNER	NEEDED BY	BLOCKING
New portrait session — three approved images, print resolution	Principal + commissioned photographer	Week 3	P01, P07, F15
Field photography archive — Liberia, Tanzania, Rwanda, Dakar, New York, Liptako-Gourma	Principal	Week 4	P02, P03
Pronunciation audio recording	Principal	Week 4	F04
Sign-off on the identity block and title history (Section 2.1)	Principal	Week 2	F04, everything downstream
Six speaking themes with abstracts	Principal + content producer	Week 5	P04, Protocol Desk theme matching
Atlas node review — 45 to 60 nodes, coordinates and outcomes verified	Principal	Week 6	P03, F02, F03
Existing speech recordings and transcripts	Principal / event organisers	Week 6	P09, F12, F05 corpus
Bukom / Ga Accra photo essay	Commissioned photographer	Week 7	P01 youth door, P02
TEST for Africa data and consent-cleared scholar profiles	Trust administrator	Week 7	P10, F09
Selah entries — minimum six to launch	Principal	Week 8	P12
French translation of all launch content	Professional translator	Week 10	Launch
Rider template content and approval	Principal	Week 6	Section 8.9
Correspondence templates approved (nine, both languages)	Principal	Week 7	Section 8.10
Counterparty watch list — initial population	Principal	Week 5	Section 8.5 conflict screening
Domain, DNS, and mail authentication records	XCreativs + Principal	Week 2	Everything
Data Protection Commission registration	XCreativs legal + Principal	Week 1 (start)	Launch
Written authorisation for the Doctrine Engine (F05)	Principal	Week 12	F05 only

SCHEDULE WARNING

Three items on this list have historically sunk projects like this one: the portrait session, the Atlas node review, and the French translation. All three require the Principal's personal, uninterrupted

ASSET	OWNER	NEEDED BY	BLOCKING
attention, and all three are on the critical path. Book the portrait session and a three-hour Atlas review block in week one, before anything else is scheduled. Commission the translator before the copy is finished — good development-sector translators are booked months ahead.			

16 Delivery Plan

16.1 Phasing

Sixteen weeks to public launch, with the Doctrine Engine deliberately held back to a post-launch phase. The sequencing principle: build the features that reduce the Principal's daily friction first, the features that persuade second, and the features that carry risk last.

PHASE	WEEKS	DELIVERED	GATE
0 — Discovery and foundations	1–2	Principal interviews; identity block sign-off; domain and mail authentication; DPC registration started; design tokens; repository, CI and environments; content model implemented	Identity block signed off by the Principal
1 — The spine	3–5	F04 identity registry and press room; P07; design system and core components; P01 default homepage; P02 narrative record; portrait session shot	Press Room usable by a real journalist
2 — The Desk	6–9	F07 Protocol Desk end to end — intake, screening, Protocol Note, lifecycle, correspondence, admin console, calendar sync; P04 and P05; F15 Living Dossier	A real speaking request completes the full lifecycle in staging
3 — The evidence	10–12	F02 Atlas and table twin; F03 Two Ledgers; F01 Adaptive Dossier; P03; F11 Sahel Mode; F14 Night Economy	Performance budgets met on a real mid-range Android
4 — The voice	13–14	F06 Signal Board and Foresight Ledger; F12 Quotable Archive; P06, P09; F10 Selah; F13 The Room	Two-person publish rule verified; The Room penetration-tested
5 — Bilingual, hardening and launch	15–16	French content integrated and reviewed; accessibility audit; security review; load test; content freeze; launch	WCAG 2.2 AA verified externally; security review closed
6 — Post-launch (optional)	17–22	F05 Doctrine Engine behind written authorisation; F08 Office Hours; F09 Legacy Ledger; first monthly measurement cycle	Written authorisation for F05 received

16.2 Team

ROLE	ALLOCATION	PHASES
Product Lead / Delivery	50%	All
Senior Product Designer	100% phases 0–3, 50% thereafter	0–5
Senior Frontend Engineer	100%	1–6
Frontend Engineer	100%	2–5
Backend Engineer	100%	2–6
AI / Data Engineer	50%	4, 6
Content Producer / Editor (EN)	75%	0–5
Professional Translator (FR)	Contract	4–5
QA Engineer	50% phases 2–4, 100% phase 5	2–5
Photographer	Contract — two shoots	1, 2

16.3 Working practice

- Two-week sprints; issue tracking in Jira with epics named by feature code (F01–F15) and stories carrying page codes (P01–P13).

- Communication in Microsoft Teams, with a single dedicated channel for the Principal that is kept free of engineering detail.
- A fortnightly thirty-minute review with the Principal, in which he is shown working software, never slides. This is the XCreativs practice and it applies here without exception.
- A standing weekly content chase with a published outstanding-items list from Section 15.
- Grafana dashboards and Opsgenie rotas established in phase 0, not at launch.

17 Quality and Acceptance

17.1 Definition of done — per story

- Meets the specification in this document, including both locales.
- Responsive and verified at 360, 768, 1024 and 1440 pixels.
- Keyboard-operable end to end with a visible focus state; axe-core clean; manually screen-reader tested for any interactive feature.
- Renders and functions in Sahel Mode.
- Within the performance budget in Section 10.4.
- Unit tested where there is logic; Playwright end-to-end tested where there is a user journey.
- No hard-coded strings — all copy and all identity fields resolved from the CMS or the registry.
- Reviewed by one other engineer and accepted by the Product Lead against the specification.

17.2 Support matrix

CATEGORY	SUPPORTED
Browsers	Chrome, Safari, Firefox and Edge — current and previous major versions. Samsung Internet current version.
Devices	iPhone 12 and later; mid-range Android from the Moto G Power class upward; iPad; desktop at 1280 and above.
Networks	Fibre, 4G, 3G and 2G. The 2G target is Sahel Mode and it is a tested requirement, not an aspiration.
Assistive technology	VoiceOver on iOS and macOS; NVDA on Windows; TalkBack on Android.
Locales	en-GB and fr-FR. British English spelling throughout — the Ghanaian institutional standard.

17.3 Pre-launch checklist

- External accessibility audit passed at WCAG 2.2 AA and remediation closed.
- Independent security review and penetration test completed, with The Room and the Protocol Desk in scope; all high and critical findings closed.
- Load test at one hundred times baseline traffic with the Protocol Desk remaining functional.
- SPF, DKIM and DMARC verified; test correspondence successfully delivered into a [.gov.gh](#), a [.un.org](#) and an EU institutional mailbox.
- Every one of the nine correspondence templates sent, read and approved by the Principal in both languages.
- Data Protection Commission registration confirmed; privacy notice, terms and disclosure page live and legally reviewed.
- Every claim on the site traced to a Source Register entry — a full manual pass, no sampling.
- Preview environments locked down and de-indexed; confirmed absent from search results.
- Rollback rehearsed: a deliberate bad publish rolled back inside fifteen minutes.
- The Principal has personally completed a Protocol Desk request end to end, on his own phone, and approved the experience.

18 Risks, Assumptions and Decisions Required

18.1 Risk register

RISK	IMPACT	LIKELIHOOD	MITIGATION
Content dependency on the Principal's time	High — this is the single most likely cause of a slipped launch	High	Week-one booking of the portrait session and Atlas review; a weekly published chase list; phase gates that do not depend on content that has not arrived
Doctrine Engine produces an answer that embarrasses him	Severe — political and institutional	Medium if built carelessly	Retrieval-only generation; hard refusal boundary; post-launch phase; written authorisation required; invite-only period; instant retraction
A change of government or of his role mid-build	Medium	Medium	Versioned titles (F04); no partisan content; no government insignia; the site survives a role change with one CMS edit
Perception that the site is an official government platform	High — reputational and constitutional	Medium	Footer disclaimer in both languages on every page; disclosure page; visual separation; no insignia
French quality falls short and reads as translated	Medium — undermines the francophone positioning entirely	Medium	A named professional translator engaged early; French typography rules at the render layer; native review before launch
Atlas scope expands beyond its budget	Medium	High	Node count capped at 60 for launch; the table twin built first; motion layered last
The Foresight Ledger creates future discomfort	Medium	Medium	Discussed and agreed with the Principal before build; no deletions permitted; resolution notes are his own words
Low-bandwidth requirement is descoped under schedule pressure	Medium — costs the platform its most on-message feature	Medium	Sahel Mode is a Must and a CI-enforced budget, not a nice-to-have
Third-party outage during a high-traffic news moment	Medium	Low	Static generation, edge caching, adapter interfaces with defined degradation for every integration

18.2 Assumptions

- The Principal is able to give approximately twelve hours of personal time across the sixteen weeks, concentrated in phases 0, 1 and 3.
- A designated Desk Officer will be nominated to operate the Protocol Desk day to day. The system is buildable without one, but it will not work well.
- The Tertiary Education Scholarship Trust will provide scholar data and consent records.
- Existing speech recordings can be obtained from past organisers. Where they cannot, the archive launches thinner and grows.
- The Principal's calendar is on a platform supporting CalDAV or Microsoft Graph.
- A domain is available in the form ishmaeldodoo.com or .africa. Secure both plus common misspellings in week one.

18.3 Decisions required from the Principal

These block phases and should be resolved in the phase-0 interviews. Each is a decision only he can take.

- 01 Domain.** Which domain, and in whose name is it registered? Registration in his own name rather than a company's is strongly recommended.

- 02 The Foresight Ledger.** Is he willing to publish a scorecard that will, over time, show calls that did not hold up? If not, F06 ships as a Signal Board without the Ledger. This must be decided before design, not after.
- 03 The Doctrine Engine.** Does he want an AI-grounded answering layer at all, or the curated Positions page alternative described in F05? Either is defensible.
- 04 Selah.** Is he comfortable with a page in his personal and spiritual register on a professional platform? It is a strong feature and it is also unmistakably personal.
- 05 Green Horizon Ventures.** How prominently should the blind-trust interest appear in the record? The recommendation is factual, complete and unpromoted — but it is his call.
- 06 Office Hours.** Can he commit to a small number of twenty-minute sessions each month, indefinitely? The feature depends entirely on the commitment being real; a lapsed ballot is worse than no ballot.
- 07 The Desk Officer.** Who is it, and what is their authority?
- 08 The counterparty watch list.** Who maintains it, and how often is it reviewed?
- 09 Honorarium policy.** What is his standing position for personal-capacity engagements? The system needs a default even if every case is decided individually.
- 10 Photography.** Will he release his personal field archive? The Atlas and the record are substantially stronger with it and noticeably generic without it.

A Source Register

Every biographical and factual claim in this specification derives from one of the sources below. The register is reproduced in the CMS as the [source](#) collection and published at </record/sources>. Content producers must extend it rather than working around it.

REF	SOURCE	USED FOR
S01	Full CV: Ishmael Nii Amanor Dodoo, dated 3 September 2025 — supplied by the Principal	Employment record, education, portfolio values, country experience, achievements. The primary source for Sections 2.2, 2.3 and Appendix B.
S02	Ghana News Agency, 14 April 2025 — coverage of the GIPC 24-Hour Premium Service launch	The 80 per cent import figure; cassava, ethanol and starch; the fabric yardage figures; the "citizen's vision" framing.
S03	Business & Financial Times / GhanaWeb, 2 July 2025 — blended finance and the \$4 billion plan	The \$4 billion mobilisation architecture; the \$1 billion Value Chain Financing Facility; concessional terms; the grant de-risking layer; GILF SPVs; Africa50, Afreximbank, AfDB and World Bank as targeted capital sources.
S04	GhanaWeb, 27 August 2025 — Volta Trade and Investment Fair, Juapong	The \$1.5 billion textile import figure; Volta Corned Beef and the industrial-memory argument; the Volta Economic Corridor; 8.2 million tonnes; the \$1.3 trillion West African market.
S05	MyJoyOnline, 12 November 2025 — Ghana Digital and Innovation Week 2025	Digital transformation as a precondition; the round-the-clock opportunity framing; youth as the heartbeat; online education and finance, smart cities, energy.
S06	Asaase Radio, 23 February 2026 — Asaase Breakfast Show (two reports)	The structural-transformation framing; the three pillars; the \$2 billion post-harvest loss figure; the sub-40 per cent capacity utilisation; the \$3.5 billion food import and \$27 billion West African pharmaceutical figures; "an outcome, not a mandate"; "we don't replace ministries".
S07	Graphic Online, July 2026 — Made-in-Ghana Business Summit	His role delivering the Presidential Adviser's statement; the "Director of Partnerships, 24-Hour Economy Authority" title instance.
S08	GhMusicHype, October 2025 — GA Youth Forum launch	The keynote; the GaDangme civic connection.
S09	YouTube, 1 October 2025	"You can come from Bukom and become the best in the world."
S10	Green Horizon Ventures, 25 March 2025 — leadership announcement	Twenty-five years across 36 countries; the blockchain carbon markets role; the \$1 billion development financing ambition.
S11	MyJoyOnline, 19 January 2026 — GIPC business forum with the Japanese delegation	Attendance alongside GIPC, Ghana Free Zones Authority and GEPA leadership; the "Director and Head of Innovation, Partnerships and Markets" title instance.
S12	YFM Ghana, 16 March 2026 — Ghana Beverage Awards Industry Forum	A further title instance; the AfCFTA and beverage-industry speaking context.
S13	TechFocus24 / JoyNews The Pulse, July 2026	The "Chief Partnership Officer" title instance; unemployment commentary.
S14	TransformAfricaNow	"Anyone who wants to lead Africa's transformation must first transform themselves."
S15	LinkedIn — Dr. Ishmael Nii A. Dodoo, public profile	The "Dr. Ish" familiar name; the "Selah" signature; carbon chain-of-custody commentary; the youth migration position.
S16	Ghanamma, July 2026 — Ghana Garden and Flower Movement, 14th Annual Show launch	A further "Chief Partnership Officer, 24H+" title instance; the green-economy speaking context.

B Structured Record for CMS Seeding

Source: S01. This is the seed data for the [atlasNode](#) collection and for the Two Ledgers. Coordinates and outcome detail require the Principal's review before publication (Section 15).

B.1 Employment record

PERIOD	ROLE	INSTITUTION	LOCATION
Feb 2025 – present	Director and Head of Partnership and Markets; Chief Partnership Officer	24H+ Secretariat / 24-Hour Economy Authority, Office of the President	Accra, Ghana
Aug 2023 – Feb 2025	Executive Vice President and Co-Founder (in blind trust)	Green Horizon Ventures / CO2 Capital Africa Project Ltd	Kigali, Rwanda
Jul 2020 – Aug 2023	Programme Coordinator and Team Leader, UN Sahel Joint Programme	UNDP Regional Office, West and Central Africa	Dakar, Senegal
Jun 2019 – Jun 2020	Officer in Charge and Director a.i., Implementation Support Unit	Office of the Special Coordinator for Development in the Sahel	Dakar, Senegal
Jul 2018 – Jun 2019	Senior Policy Adviser and Chief of Office	Office of the UN Secretary-General's Special Adviser for the Sahel	Dakar, Senegal
Jul 2016 – Jun 2017	Policy and Development Affairs Officer (secondment)	Executive Office of the UN Secretary-General	New York, USA
Mar 2015 – Jul 2018	Country Oversight Adviser	UNDP Africa Regional Bureau	New York, USA
Dec 2014 – Mar 2015	Ebola Response Focal Point	UNDP Africa Regional Bureau	New York, USA
Apr 2014 – Sep 2014	Deputy Country Director a.i. (special assignment)	UNDP Rwanda	Kigali, Rwanda
Dec 2012 – Dec 2014	Country Programme Specialist	UNDP Africa Regional Bureau	New York, USA
Aug 2010 – Dec 2012	Head of Partnership and Management Support	UNDP Tanzania	Dar es Salaam, Tanzania
Jun 2008 – Aug 2010	Assistant Resident Representative	UNDP Liberia	Monrovia, Liberia
Aug 2003 – Jun 2008	Project Manager	ProForest Ltd	Oxford, United Kingdom
Jun 1998 – Aug 2003	Community Project Officer	Ghana Wildlife Society	Accra, Ghana

B.2 Education and certification

AWARD	INSTITUTION	YEAR
Doctorate in Strategic Leadership, focus on organisational foresight (in progress)	Oral Roberts University, USA	2023 – present
DPhil in Public Administration, honoris causa	Adam Smith University, USA	2017
MSc Environmental Change and Management (merit) — environmental policy and natural resources governance	University of Oxford, UK	2003–2004
BSc Natural Resources Management, First Class Honours	Kwame Nkrumah University of Science and Technology, Kumasi	1994–1998
UN Professional Certification — Strategic Leadership and Management	United Nations	2014
UN Professional Certification — IPSAS financial and revenue modules	United Nations	2012

AWARD	INSTITUTION	YEAR
UN Professional Certification — Audit and Harmonized Approach to Cash Transfer	United Nations	2010
UN Professional Certification — Procurement and Responsible Sourcing; PRINCE2 Project Cycle Management	United Nations	2008

B.3 Honours

- Distinguished UNDP Lead Fellow, 2008 — selected as an African representative among eighteen global young leaders from more than six thousand applicants.
- Norman and Ivy Lloyd Africa Fellow, Linacre College, University of Oxford, 2003 — featured in the Oxford University Annual Review.
- Co-founder, Tertiary Education Scholarship Trust (TEST for Africa).
- Doctorate in Public Administration conferred honoris causa in recognition of his contribution to the Ebola crisis response and to African geopolitical and international relations scholarship as a senior UN official.

B.4 Country experience

Recorded in S01 as significant experience with the United Nations, private consultancy and NGOs across several African countries and globally, including the ECOWAS, IGAD and East African Community regions, and beyond Africa in the United Kingdom, Belgium, the Netherlands, Norway, Sweden, Malaysia, Singapore, Paraguay, Thailand and Papua New Guinea. Named Sahel countries of operation: Burkina Faso, Chad, Mali, Mauritania, Niger, Nigeria, Guinea, The Gambia, Cameroon and Senegal. Named Ebola-response countries: Guinea, Liberia, Sierra Leone and Mali.

Atlas note: the figure of thirty-six countries used publicly by Green Horizon Ventures (S10) should be reconciled against the node count before the Atlas states a number. If the reconciled count differs, publish the reconciled count. Do not publish a number the underlying nodes cannot support.

C Draft Copy Deck

First-draft English copy for the content producer to develop and for the Principal to approve. French follows translation, not adaptation — the register should be identical.

C.1 Homepage declaration

HERO

Dr. Ishmael Nii Amanor Dodoo

Chief Partnership Officer, 24-Hour Economy and Accelerated Export Development Programme, Office of the President, Republic of Ghana

Twenty-five years turning declared intentions into delivered outcomes — from community forests in Ghana's Western Region, to the Executive Office of the United Nations Secretary-General, to the borderlands of the Sahel, and now to the commercial architecture of Ghana's largest economic restructuring in a generation.

C.2 The five doors

- **Government and multilateral.** *You need someone who can make institutions that do not naturally cooperate move together.*
- **Capital.** *You are looking for structured, de-risked pipeline in West Africa, and someone who knows how it is built.*
- **Conference and media.** *You are building a programme and you need a speaker who will not let you down.*
- **Youth.** *You want to know how someone gets from Bukom to the Secretary-General's office.*
- **Philanthropy.** *You want to put money somewhere it will land on a student who would otherwise not go.*

C.3 The six speaking themes — draft titles and abstracts

- **The demand was always there.** Why an import bill is not evidence of weak industry but proof of unmet domestic demand — and what it takes to capture it. Built from the 24-Hour Economy argument and the West African trade data.
- **Patient capital in impatient markets.** Blended finance, concessional lending, de-risking grants and special purpose vehicles — how to structure money so that it reaches an SME in a value chain rather than sitting in a fund.
- **Coordination is the scarce resource.** What it actually takes to make nineteen agencies, ten governments and a dozen donors deliver one outcome. Drawn from the Sahel.
- **Delivering in the hardest places.** Water, nutrition, jobs and trade across the Burkina–Mali–Niger tri-border. What works, what does not, and what nobody writes in the reports.
- **The industrial memory of a nation.** Volta Corned Beef, the first transistor radios in West Africa, televisions built in Accra — and why recovering confidence is a prerequisite for recovering capacity.
- **Transformation begins with the self.** The personal register. Leadership, foresight, and what it costs to become the person a transformation requires. For youth and leadership audiences.

C.4 Protocol Desk — correspondence drafts

Acknowledgement

Subject: Your invitation to Dr. Ishmael Nii Amanor Dodoo — reference PD-2026-0417

Thank you for your invitation to Dr. Dodoo. It has been received and carries the reference above. Every request is reviewed personally, and you will receive a substantive response within forty-eight hours — including if the answer is that he is unable to accept. If we need anything further to consider it properly, we will write to you before then.

Decline — diary

Subject: Your invitation — reference PD-2026-0417

Thank you for inviting Dr. Dodoo to speak. He has asked me to say that he would have liked to accept and is unable to, for reasons of diary rather than of interest — he has an existing commitment on those dates. He hopes you will consider him again for a future edition, and asks that you keep him on your list. If it would be useful, the press room carries his current biography, approved portraits and a set of his published remarks, which you are welcome to use.

Decline — conflict

Subject: Your invitation — reference PD-2026-0417

Thank you for your invitation. Dr. Dodoo holds public office in Ghana, and on review this engagement raises a conflict with the responsibilities of that office. He is therefore unable to accept, and would rather tell you so plainly than let the matter sit. This is not a judgement of your event and he is grateful to have been asked.

C.5 Footer disclaimer — required wording**SITEWIDE FOOTER**

This is the personal website of Dr. Ishmael Nii Amanor Dodoo. It is not an official publication of the 24-Hour Economy and Accelerated Export Development Authority, the Office of the President, or the Government of Ghana. Views expressed here are his own.

Ce site est le site personnel du Dr Ishmael Nii Amanor Dodoo. Il ne constitue pas une publication officielle de l'Autorité de l'Économie 24 Heures et du Développement Accéléré des Exportations, de la Présidence de la République, ni du Gouvernement du Ghana. Les opinions qui y sont exprimées lui sont propres.

C.6 Sahel Mode toggle label

Built to work on a Sahel connection. — one line, no explanation, no icon beyond a simple signal glyph.

End of specification.
